| shutter          | shutter          | 0.5           | Enter the number of frames the shutter stays open when motion blurring. For example, a value of 0.5 corresponds to half a frame. Increasing the value produces more blur, and decreasing the value less.                                                                                                                                                                                                     |
| shutter offset   | shutteroffset    | start         | <p>Controls how the shutter behaves with respect to the current frame value:</p> <ul style="list-style-type: none"> <li>• <b>centred</b> - center the shutter around the current frame. For example, if you set the shutter value to 1</li> </ul>                                                                                                                                                            |

| Control (UI) | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------|---------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                     |               | <p>and your current frame is 30, the shutter stays open from frame 29,5 to 30,5.</p> <ul style="list-style-type: none"> <li>• <b>start</b> - open the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 30 to 31.</li> <li>• <b>end</b> - close the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29 to 30.</li> <li>• <b>custom</b> - open the shutter at the time you specify. In the field next to the dropdown menu, enter a value (in frames) you want to add to the current frame. To open the shutter before the current frame, enter a negative value. For example, a value of - 0.5 would open the shutter half a frame before the current frame.</li> </ul> |
|              | shuttercustomoffset | 0             | <p>If the <b>shutter offset</b> control is set to <b>custom</b>, this field is used to set the time that the shutter opens by adding it to the current frame. Values are in frames, so -0.5 would open the shutter half a frame before the current frame.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

# Sharpen

Uses Laplacian to sharpen specific channels from the input image. Apply different smoothing filters to the output to trade off between speed (**box**) and quality (**gaussian**).

See also [Soften](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to receive the sharpen effect.                                                                                                                                                                                                                                                                                                                     |
|                 | mask            | <p>An optional image to use as a mask. By default, the blur is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                              |
|--------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sharpen Tab  |                  |               |                                                                                                                                                                                                       |
| channels     | channels         | none          | <p>The effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> |
| minimum      | minimum          | 0             |                                                                                                                                                                                                       |
| maximum      | maximum          | 1             |                                                                                                                                                                                                       |
| amount       | amount           | 1             |                                                                                                                                                                                                       |
| size         | size             | 1             | Adjusts the size of pixels within the channel defined by the <b>channels</b> control. Values less than 3 increase the light pixels and vice versa.                                                    |
| filter       | filter           | gaussian      | <p>Sets the filter algorithm to use:</p> <ul style="list-style-type: none"> <li>• box</li> <li>• triangle</li> <li>• quadratic</li> <li>• gaussian</li> </ul>                                         |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                        |
|----------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |               |  <b>Note:</b> Box is the fastest to render, whereas Gaussian blur is the smoothest.                                                                                                                                                            |
| n/a            | quality          | 15            | <p>Controls the level of filtering quality. Entering a low number runs the calculation more quickly, but the end result isn't quite as smooth.</p> <p>The image is scaled down during the calculation, so that the blur filter is no larger than this number, and then scaled up with linear interpolation after filtering.</p> |
| crop to format | crop             | enabled       | When enabled, crop the resulting image to the format. If the bounding box is at or inside the format, don't enlarge it past the format. This avoids creating oversized images that you don't need.                                                                                                                              |
| mask           | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                   |
|                | maskChannelInput | none          | The channel to use as a mask. By default, the effect is limited to the non-black areas of this channel.                                                                                                                                                                                                                         |
| inject         | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                    |
| invert         | invert_mask      | disabled      | Inverts the use of the mask channel, so that the effect is limited to the non-white areas of the mask.                                                                                                                                                                                                                          |
| fringe         | fringe           | disabled      | <p>When enabled, only apply the effect to the edge of the mask.</p> <p>When disabled, the effect is applied to the entire mask.</p>                                                                                                                                                                                             |
| mix            | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                                                                                                                                                                                                                             |

# Soften

Uses Laplacian to soften specific channels from the input image. Apply different smoothing filters to the output to trade off between speed (box) and quality (gaussian).

See also [Sharpen](#).

|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------|
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask. |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                          |

# VectorBlur

Generates motion blur by blurring each pixel into a straight line, using the values from the motion vector channels (u and v channels) to determine the direction of the blur. You can create motion vectors using the VectorGenerator, MotionBlur2D, MotionBlur3D, ScanlineRender, or RayRender nodes. Many third-party applications can also produce motion vector information as two-channel, floating point images that you can use with VectorBlur. If possible, you should unpremultiply these images.

You can use the constant **uv offset** values to add motion blur for camera movement and shake. Subtract the xy translation or camera rotation at the current frame from the same values at the next frame to get the correct values to use.

See also [VectorGenerator](#), [MotionBlur2D](#), [MotionBlur3D](#), [ScanlineRender](#), and [RayRender](#).

## Inputs and Controls

| uv alpha         | N/A              | disabled      | Enables the associated alpha channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                  |
|                  | alpha            | none          | <p>If your motion vectors were premultiplied, set this channel to the channel used to multiply the vectors to improve the results.</p> <div>  <b>Tip:</b> Where possible, use vectors that have not been premultiplied. </div> |
| motion blur      |                  |               |                                                                                                                                                                                                                                                                                                                 |
| blur type        | blur_type        | gaussian      | <p>Sets the profile to use along the direction of blur:</p> <ul style="list-style-type: none"> <li>• <b>uniform</b> - a box-like profile with uniform weighting along the blur vector.</li> <li>• <b>gaussian</b> - a gaussian profile with a softer fall-off towards the ends of the blur vector.</li> </ul>   |
| motion amount    | scale            | 0             | Sets the value by which the u and v channels are multiplied. Set this to 0.5 for motion blur from a standard shutter.                                                                                                                                                                                           |
| motion falloff   | motion_falloff   | 0.33          | Controls the steepness of the gaussian fall-off on the blur. 0 gives a very sharp fall-off, while 1 gives a shallow fall-off.                                                                                                                                                                                   |
| motion offset    | offset           | -0.5          | Sets the shutter offset, causing the shutter to open at <b>frame</b> +/- <b>motion offset</b> .                                                                                                                                                                                                                 |
| expand blur bbox | grow_bbox        | 0             | Sets the number of pixels added to the outside edge of image. Set this manually for cropped images with non-zero uv channels.                                                                                                                                                                                   |
| soft lines       | soft_lines       | disabled      | When enabled, increase the softness of the motion blur by drawing wider lines, at the expense of slower processing.                                                                                                                                                                                             |
| blur inside      | blur_inside      | enabled       | When soft lines is enabled, apply a small blur inside regions with zero motion, to give a                                                                                                                                                                                                                       |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                     |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | smoother transition to areas with motion blur.                                                                                                                                                                                                                                                                               |
| normalize    | normalize        | enabled       | <p>When enabled, normalize the results to compensate for tearing (holes appearing behind moving objects) and collisions (objects moving on top of one another) in the rendered output.</p> <p>Normalizing can exacerbate the effects of tearing and collisions, but it tends to give a softer blur than not normalizing.</p> |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                |
|              | maskChannelInput | none          | The channel to use as the alpha channel.                                                                                                                                                                                                                                                                                     |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                 |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel, so that the effect is limited to the non-white areas of the mask.                                                                                                                                                                                                                       |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.                                                                                                                                                                                                                                                                 |
|              |                  |               | When disabled, the effect is applied to the entire mask.                                                                                                                                                                                                                                                                     |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                                                                                                                                                                                                                          |

# VolumeRays

The VolumeRays node is actually a gizmo (a group of nodes) designed to create ray lighting effects radiating from the **vol\_pos** indicator in the Viewer.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | img             | The image sequence to receive the VolumeRays effect.                                                                                                                                                                                                                                                                                                                    |
|                 | mask            | <p>An optional image to use as a mask. By default, the effect is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Tab            |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Volumetric Creation | style            | RGB Luminance | <p>Sets the style of rays to create, dependent on the available input channels:</p> <ul style="list-style-type: none"> <li>• <b>RGB Luminance</b> - creates rays based on the input image luminance.</li> <li>• <b>Alpha Edges</b> - creates rays based on the input image alpha's edges. This setting has no visible effect on full frame alphas because the rays are created outside the format.</li> <li>• <b>Alpha Solid</b> - creates rays based on the input image's entire alpha.</li> <li>• <b>Shadow Making</b> - creates rays using the input image's alpha to cast shadows.</li> </ul> |
| RGB Options         |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Luma Tolerance      | luma_tol         | 0             | Sets the base luminance below which rays are not generated. Increasing this value eliminates rays produced from low luminance areas of the image.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Control (UI)       | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                           |
|--------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Alpha Options      |                  |               |                                                                                                                                                                                                                                                                                                                    |
| Edge Size          | edge_size        | 0             | Adjusts the thickness of the alpha's edges, controlling the amount of rays affected by the alpha. Positive values decrease the number of rays allowed past the edges and vice versa.                                                                                                                               |
| Edge Blur          | blur_size        | 3             | Controls the amount of blur applied to rays at the alpha's edges.                                                                                                                                                                                                                                                  |
| Volume Options     |                  |               |                                                                                                                                                                                                                                                                                                                    |
| Volumetrics Center | vol_pos          | 100,100       | Sets the x and y positions for the <b>vol_pos</b> widget in the Viewer.                                                                                                                                                                                                                                            |
| Ray Length         | raylength        | 20            | Sets the length of the generated rays.                                                                                                                                                                                                                                                                             |
| Pre-Ray Blur       | pre_blur         | 0             | Sets the amount of blurring applied to the rays.                                                                                                                                                                                                                                                                   |
| Quality            | quality          | Medium        | Controls the quality of the rays produced: <ul style="list-style-type: none"> <li>• Low</li> <li>• Medium</li> <li>• High</li> <li>• Very High</li> </ul> <div>  <b>Note:</b> Higher quality rays take longer to render. </div> |
| Add on Top         | comp_me          | disabled      | When enabled, the effect overlay and the input image are passed from the node.<br><br>When disabled, only the effect is passed from the node for compositing purposes.                                                                                                                                             |
| Flicker Options    |                  |               |                                                                                                                                                                                                                                                                                                                    |
| Use Flickering     | chk_flicker      | enabled       | When enabled, the <b>Flicker Options</b> are applied to the rays.                                                                                                                                                                                                                                                  |
| Flicker Speed      | flicker_speed    | 2             | Controls the speed of ray flickering. Higher values produce more flicker.                                                                                                                                                                                                                                          |

| Control (UI)                       | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                   |
|------------------------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flicker Size                       | flicker_size     | 40            | Controls the size of flicker to generate artificially if the vol_pos widget is static.<br><br><div>  <b>Note:</b> If <b>Transform Noise with Volume Center</b> is enabled, this control has no effect on the rays. </div> |
| Transform Noise with Volume Center | xform_flicker    | disabled      | When enabled, flicker noise moves with the <b>vol_pos</b> widget so that flickering is the result of the <b>FlickerSpeed</b> only.<br><br>When disabled, flicker is artificially generated using the <b>Flicker Size</b> value.                                                                            |
| Color Options                      |                  |               |                                                                                                                                                                                                                                                                                                            |
| Desaturate before Coloring         | chk_desat        | disabled      | When enabled, the input image is fully desaturated so that generated rays do not pickup color from the input.                                                                                                                                                                                              |
| Volume Gamma                       | CCorrect1_gamma  | 1             | Controls the overall amount of Gamma applied to the generated rays.                                                                                                                                                                                                                                        |
| Volume Gain                        | CCorrect1_gain   | 1             | Controls the overall amount of Gain applied to the generated rays.                                                                                                                                                                                                                                         |

| Mask Blur                         | mask_blur        | 0             | Adjusts the blur applied to the edges of the mask.                                                                                                                                                                                                   |
| Transform Mask with Volume Center | chk_xform_mask   | disabled      | <p>When enabled, the mask and <b>vol_pos</b> widget's relative positions are maintained - any transform applied to the <b>vol_pos</b> widget is applied to the mask.</p> <p>When disabled, the mask is not transformed by <b>vol_pos</b> widget.</p> |

# ZDefocus

Blurs the image according to a depth map channel. This allows you to simulate depth-of-field (DOF) blurring.

In order to defocus the image, ZDefocus splits the image up into layers, each of which is assigned the same depth value everywhere and processed with a single blur size. After ZDefocus has processed all the layers, it blends them together from the back to the front of the image, with each new layer going over the top of the previous ones. This allows it to preserve the ordering of objects in the image.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | filter          | <p>This image is used as the blur kernel. It represents the shape and size of the camera aperture used to shoot the input footage. As the clip in the <b>image</b> input is blurred, any out-of-focus highlights ('bokeh') in the clip assume the shape of the <b>filter</b> image.</p> <p>You can create a filter image using the Roto node (<b>Draw &gt; Roto</b>) or the Flare node (<b>Draw &gt; Flare</b>), for example. The filter image can also be a color image. For example, if you want to add color fringing to your out-of-focus highlights to simulate chromatic aberration, you can use the Flare node to easily create a suitable filter image.</p> <p>You don't necessarily need to crop the filter image to a smaller size, as Fast Fourier Transforms are used to speed up convolutions with large filter images.</p> |
|                 | image           | The image sequence to receive the blur effect. This should also contain the depth map channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                 | mask            | <p>An optional image to use as a mask. By default, the blur is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| fill foreground | fill_foreground  | enabled       | <p>When enabled, Nuke attempts to compensate for missing information by filling regions in the foreground which are revealed when the foreground goes out of focus.</p> <p>You can try enabling this control if you see sharp edge artefacts in blurred objects in front of the focal point (nearer to the camera). However, because the true image information isn't available in these regions, enabling <b>fill foreground</b> can sometimes introduce undesirable artefacts by adding things which aren't there. If you see blurry artefacts in the foreground, rather than sharp edge artefacts, try disabling this control.</p> |
| focus plane (C) | center           | 0             | Sets the Z depth of areas in the image that are entirely in focus.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| focal point xy  | focal_point      | 200, 200      | Controls the position of the <b>focal point</b> widget in the Viewer. Adjusting the Viewer widget updates the <b>focusplane</b> and <b>focalpoint</b> fields automatically.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Control (UI)            | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| depth of field          | dof              | 0             | <p>Sets a depth slice around the focus plane that is entirely in focus.</p> <div>  <b>Note:</b> True theoretical depth of field would set this to zero. </div>                                                                                                                                                                                                           |
| blur inside             | blur_dof         | enabled       | <p>When enabled, a small amount of blur is applied to the in-focus region. This gives a smoother transition between the in-focus region and the out-of-focus regions around it.</p>                                                                                                                                                                                                                                                                       |
| size                    | size             | 25            | <p>Sets the size of the blur at infinite depth. Blur nearer the camera than the focus plane may be larger.</p> <p>If you have set <b>math</b> to <b>direct</b>, the size is multiplied by the depth to give the blur size at that depth. Setting <b>size</b> to 1 allows you to use the values in the depth map as the blur size directly.</p>                                                                                                            |
| maximum                 | max_size         | 50            | <p>The filter size is clipped at this maximum value. No blurring greater than this value is generated no matter where the object is in relation to the camera.</p> <p>Set this value as low as possible for maximum processing speed.</p>                                                                                                                                                                                                                 |
| automatic layer spacing | autoLayerSpacing | enabled       | <p>When enabled, ZDefocus automatically works out how many depth layers to use, based on the maximum blur size (<b>maximum</b>). In this mode, the layers are closer together near to the focal plane, where a small change in the blur amount is more obvious, and increasingly more widely-spaced further away.</p> <p>When disabled, you can control the depth layers and their spacing manually using <b>depth layers</b> and <b>layer curve</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| depth layers | nLayers          | 20            | <p>The number of depth layers to use for the blur. Use a small number of layers for maximum speed.</p> <p>The maximum number of blur sizes that are used between 0 and <b>maximum</b> is 256. This means you can have up to 256 layers behind the focal plane, and up to 256 in front of it as well.</p>                                                                                 |
| layer curve  | layerCurve       | 1             | <p>The curve to apply to the layer spacing.</p> <p>A value of 0 gives evenly spaced layers. Positive values concentrate the layers closer to the in-focus region. Negative values mean the layers are concentrated far from the focal plane, towards the <b>maximum</b> blur size.</p>                                                                                                   |
| filter type  | filter_type      | disc          | <p>Sets the blur filter applied to the image:</p> <ul style="list-style-type: none"> <li>• <b>disc</b> - applies a round disc filter to the image.</li> <li>• <b>bladed</b> - applies a bladed filter to the image (simulates the iris blades that can make up a camera's diaphragm).</li> <li>• <b>image</b> - uses the image in the <b>filter</b> input as the blur kernel.</li> </ul> |

The following controls, up to and including **aspect ratio**, are only available when **filter type** is set to **disc**.

|              |        |   |                                                                                                                                                                                                                                                                                        |
|--------------|--------|---|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| filter shape | shape  | 0 | Dissolves the filter shape between Gaussian at 0 and disc at 1.                                                                                                                                                                                                                        |
| aspect ratio | aspect | 1 | <p>Sets the filter aspect ratio, which is 1:1 by default. Values less than 1 squeeze the filter on the x axis, and values larger than 1 squeeze it on the y axis.</p> <p>This allows you to simulate the cat's eye effect, caused by vignetting inherent within some lens designs.</p> |

The following controls, up to and including **catadioptric**, are only available when **filter type** is set to **bladed**.

|              |        |   |                                                                                                                 |
|--------------|--------|---|-----------------------------------------------------------------------------------------------------------------|
| aspect ratio | aspect | 1 | Sets the filter aspect ratio, which is 1:1 by default. Values less than 1 squeeze the filter on the x axis, and |

| Control (UI)      | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                                           |
|-------------------|-------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   |                   |               | <p>values larger than 1 squeeze it on the y axis.</p> <p>This allows you to simulate the cat's eye effect, caused by vignetting inherent within some lens designs.</p>                                                                                                                                                             |
| blades            | blades            | 5             | <p>Sets the number of iris blades that make up the camera's diaphragm. A value of 3 produces a triangle, 4 a square, 5 a pentagon, 6 a hexagon, and so on.</p> <div>  <b>Note:</b> This field only accepts integers larger than 1.         </div> |
| roundness         | roundness         | 0.2           | Controls the rounding of the filter polygon's sides, where zero is equal to no rounding.                                                                                                                                                                                                                                           |
| rotation          | rotation          | 0             | Controls filter rotation in degrees. Positive values produce counter-clockwise rotation and vice-versa.                                                                                                                                                                                                                            |
| inner size        | inner_size        | 0.8           | Controls the size of the inner polygon, as a percentage of the outer polygon.                                                                                                                                                                                                                                                      |
| inner feather     | inner_feather     | 1             | Adds outward or inward feathering around the inner polygon. With values larger than 0.5, your feather effect is outward and, respectively, if your values are smaller than 0.5, the feather effect is inward. A value of 0.5 produces no feathering.                                                                               |
| inner brightness  | inner_brightness  | 0.8           | Controls the brightness of the inner polygon, where 0 is equal to black and 1 to white.                                                                                                                                                                                                                                            |
| catadioptric size | catadioptric_size | 0.3           | When <b>catadioptric</b> is enabled, controls the size of the catadioptric hole in the filter.                                                                                                                                                                                                                                     |
| catadioptric      | catadioptric      | disabled      | <p>When enabled, ZDefocus simulates catadioptric lenses. This means the defocused areas of the image are annular, producing donut-shaped bokeh.</p> <p>You can use the <b>catadioptric size</b> to control the hole in the center of the filter.</p>                                                                               |

| Control (UI)                                                                                                                                | Knob (Scripting)   | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

If necessary, check <b>clamp image filter</b> to correct this problem.</p>  <b>Note:</b> This control is only available when <b>legacy resize mode</b> is disabled. |
| gamma correction   | bloom_gamma        | disabled      | <p>When enabled, a gamma curve of 2.2 is applied before blurring and then reversed for the final output.</p> <p>This is useful for making bokeh lens shape effects warmer and more visible.</p>                                                                                                                                                                            |
| bloom              | bloom              | disabled      | When enabled, highlights over the <b>bloom threshold</b> are boosted to make lens shape effects more visible.                                                                                                                                                                                                                                                              |
| bloom threshold    | bloom_threshold    | 0.8           | When <b>bloom</b> is enabled, highlights above this value are multiplied by the <b>bloom gain</b> value to make lens shape effects more visible.                                                                                                                                                                                                                           |
| bloom gain         | bloom_gain         | 2             | When <b>bloom</b> is enabled, highlights above the bloom threshold are multiplied by this value.                                                                                                                                                                                                                                                                           |
| mask               | N/A                | disabled      | Enable the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                               |
|                    | maskChannelInput   | none          | The channel to use as a mask. By default, the blur is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                                      |
| inject             | inject             | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                               |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                     |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------|
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel, so that the blur is limited to the non-white areas of the mask.                         |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask. |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                          |
|              |                  |               |                                                                                                                              |

# ZSlice

This node uses the depth channel of the input to highlight a slice of the image characterized by the same Z depth. You can modify the slice using the **Center of Slice** and **Field Width** controls.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The input to select the Z slice from.<br><br><div> <b>Note:</b> The input must contain a Z depth channel.</div>                                                                                                                                                               |
|                 | mask            | An optional image to use as a mask. By default, the slice is limited to the non-black areas of the mask.<br><br>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b> . |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                           |
|-----------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ZSlice Tab      |                  |               |                                                                                                                                                                                                    |
| channels        | channels         | all           | <p>The effect is only applied these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> |
| Z               | N/A              | disabled      | Enables the associated Z channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                         |
|                 | Zchan            | none          | The channel containing the Z depth information.                                                                                                                                                    |
| Center of Slice | center           | 0.5           | Defines the center, or depth, of the slice within the image. High values are closer to the camera, and lower values further away.                                                                  |
| Field Width     | dof              | 0.1           | Defines the width of the slice. Higher values highlight a thicker slice around the specified depth, and vice versa.                                                                                |
| mask            | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                      |
|                 | maskChannelInput | none          | The channel to use as a mask. By default, the slice is limited to the non-black areas of this channel.                                                                                             |
| inject          | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                       |
| invert          | invert_mask      | disabled      | Inverts the use of the mask channel, so that the slice is limited to the non-white areas of the mask.                                                                                              |
| fringe          | fringe           | disabled      | <p>When enabled, only apply the effect to the edge of the mask.</p> <p>When disabled, the effect is applied to the entire mask.</p>                                                                |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                            |
|--------------|------------------|---------------|---------------------------------------------------------------------|
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1. |

# Keyer Nodes

Keyer nodes deal with extracting procedural mattes from image sequences using luma keying, chroma keying, and difference keying.

## ChromaKeyer

ChromaKeyer is a green and bluescreen keyer that can take advantage of the local GPU. Use the **screen color** selector to choose a color from the **Source** input to use as the blue/green screen color. To remove blue/green spill from the foreground object, use the **despill bias** control to pick skin tones from the source. Use the **matte** parameters to improve the matte.

### Inputs and Controls

| Connection Type | Connection Name | Function                     |
|-----------------|-----------------|------------------------------|
| Input           | Source          | The foreground image to key. |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ChromaKeyer Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Local GPU       | gpuName          | N/A           | Displays the GPU used for rendering when <b>Use GPU if available</b> is enabled. Local GPU displays <b>Not available</b> when: <ul style="list-style-type: none"><li>• <b>Use CPU</b> is selected as the <b>default blink device</b> in the <b>Preferences</b>.</li><li>• no suitable GPU was found on your system.</li><li>• it was not possible to create a context for processing on the selected GPU, such as when there</li></ul> |

|                      |                   |               | <p>is not enough free memory available on the GPU.</p> <p>You can select a different GPU, if available, by navigating to the <b>Preferences</b> and selecting an alternative from the <b>default blink device</b> dropdown.</p> <div>  <b>Note:</b> Selecting a different GPU requires you to restart Nuke before the change takes effect. </div>                                                                                                                                                                             |
| Use GPU if available | useGPUIfAvailable | enabled       | <p>When enabled, rendering occurs on the <b>Local GPU</b> specified, if available, rather than the CPU.</p> <div>  <b>Note:</b> Enabling this option with no local GPU allows the script to run on the GPU whenever the script is opened on a machine that does have a GPU available. You should also select this if you wish to render from the command line with the <b>--gpu</b> option. </div> <p>See Nuke's <a href="#">Release Notes</a> pages for more information on the GPUs supported by your operating system.</p> |
| view                 | _view             | final result  | <p>Select what you want to render into the output.</p> <ul style="list-style-type: none"> <li>• <b>intermediate result</b> - view the intermediate result. Use this option on shots that can only be keyed using several different keys on different parts of the image (multipass keying). This renders the original source image with the matte generated in this node. In ChromaKeyer nodes down the tree, you should set the <b>inside mask</b> control to <b>source alpha</b>.</li> <li>• <b>final result</b> - this creates a premultiplied RGBA</li> </ul>                                              |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                 |
|----------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |               | foreground that can be composited later. You can produce unmultiplied output by disabling the <b>premultiply</b> control.                                                                                                                                                                                                                                |
| screen color   | _screenColor     | 0, 0, 0       | <p>Sets the screen color to become transparent, usually blue or green background.</p> <p>Click the color swatch next to <b>screen color</b> to activate the eye dropper and then <b>Ctrl/Cmd+Shift</b>+click and drag a rectangular area over the green pixels in the Viewer. This averages the pixels in the area selected to produce a better key.</p> |
| screen gain    | _screenGain      | 1             | Adjusts how much of the screen color is removed to make the screen matte. Increasing this value keys more.                                                                                                                                                                                                                                               |
| screen balance | _screenBalance   | 0.5           | Sets the balance point for the image to key. If the key is not working too well with the default setting, try setting the balance to about 0.05, 0.5 and 0.95 and see what works best.                                                                                                                                                                   |
| matte          |                  |               |                                                                                                                                                                                                                                                                                                                                                          |
| chroma gain    | _chromaGain      | 0             | <p>Controls how much of the chroma difference between the source image and the screen color is used to correct the matte.</p> <p>Increasing <b>chroma gain</b> generates a matte that has less transparent areas in the foreground, but can produce harder edges.</p>                                                                                    |
| white point    | _whitePoint      | 1             | Sets the error threshold used for correcting the foreground. All alpha values above this point are set to 1.                                                                                                                                                                                                                                             |
| black point    | _blackPoint      | 0             | Sets the error threshold used for correcting the background. All alpha values below this point are set to 0.                                                                                                                                                                                                                                             |

| Control (UI)            | Knob (Scripting)     | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|----------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| alpha bias              | _alphaBias           | 0.5, 0.5, 0.5 | Adjusts the <b>alpha bias</b> in case your screen color isn't purely blue or green and is causing parts of the foreground image to become transparent. Pick the color from the part of the foreground that is affected.                                                                                                                                                                                                                                                                                    |
| inside mask             | _insideMask          | ignore        | <p>If you're using multiple ChromaKeyer nodes to pull several different keys on different parts of the image (multipass keying), set <b>inside mask</b> to <b>source alpha</b> to add up the results of previous ChromaKeyer nodes.</p> <p>When set to <b>ignore</b>, any upstream keys are not taken into account.</p>                                                                                                                                                                                    |
| despill                 |                      |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Use custom despill bias | _overrideDespillBias | disabled      | Enables the use of the <b>despill bias</b> control.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| despill bias            | despillBias          | 0.5, 0.5, 0.5 | <p>Adjusts the <b>despill bias</b> to remove any remaining spill from around the foreground image. The most useful colors to pick for <b>despill bias</b> are often hair colors and skin tones.</p> <div>  <b>Note:</b> This control is disabled unless <b>Use custom despill bias</b> is enabled. </div>                                                                                                               |
| replace mode            | _replace             | ignore        | <p>Sets the color method to use for pixels where the alpha of the matte has been modified:</p> <ul style="list-style-type: none"> <li>• <b>ignore</b> - the despilled image is left untouched if the alpha is modified.</li> <li>• <b>edge hard color</b> - the despilled image has a corresponding amount of the <b>replace color</b> added for any increase in alpha.</li> <li>• <b>edge linear color</b> - the image has a corresponding amount of the original pixel (screen color and all)</li> </ul> |

| Control (UI)     | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|-------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

This produces a more subtle result than the <b>edge hard color</b> option.</li> </ul> |
| add-in matte fix | _replaceAlphaDiff | disabled      | When enabled, add the <b>replace color</b> into areas corrected using the matte <b>black point</b> and <b>white point</b> controls to enhance the despill effect.                                                                                                                                                                                                                                                                     |
| replace color    | _replaceColor     | 1, 1, 1       | When <b>replace mode</b> is set to <b>edge hard color</b> or <b>edge soft color</b> , sets the color to add where the alpha of the matte has been increased by the mask.                                                                                                                                                                                                                                                              |
| replace amount   | _replaceAmount    | 1             | Controls the amount of <b>replace color</b> to add in the final result.                                                                                                                                                                                                                                                                                                                                                               |
| premultiply      | _preMultiply      | enabled       | <p>When enabled, premultiply the matte generated by ChromaKeyer with the foreground.</p> <p>Premultiplying the matte can remove noise from the background, but it can also be too aggressive in some areas, such as hair.</p>                                                                                                                                                                                                         |

# Cryptomatte

Cryptomatte is a plug-in created by Foundry, based on the Cryptomatte gizmo created at Psyop by Jonah Friedman and Andy Jones. The native version of Cryptomatte is backwards compatible with version 1.2.8 of the gizmo.

You can access the Cryptomatte plug-in from the node toolbar under **Keyer** nodes or by pressing **Tab** in the Node Graph and typing Cryptomatte.

Cryptomatte creates ID mattes in applications such as Maya using organizational information available from a number of renderers including V-Ray and RenderMan. Nuke can then use the Cryptomatte plug-in to isolate individual mattes in the sequence and apply effects to only those areas of the image.

Selected mattes shown in yellow

Selected mattes used as a mask for grading

Example Node Graph

**Note:** Nuke's native Cryptomatte plug-in is a new version of the original tool, with a re-ordered **Properties** panel and vertical **Matte List** to make selections easily readable. There are three controls, **matteOnly**, **previewMode** and **singleSelection**, that are present in the Gizmo but not available when using the plug-in. For a full list of the Gizmo properties, see the [Pysop Documentation](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                     |
|-----------------|-----------------|--------------------------------------------------------------|
| Input           | unnamed         | The image sequence containing the object or material passes. |

| Remove Channels | removeChannels   | Disabled            | When enabled, all channels except rgba and the matte output channel are removed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

# Difference

This node produces the difference between two images as a matte. It takes two inputs:

- input **B** contains the subject with the background, and
- input **A** contains the background without the subject (a clean plate).

You can use this node to produce a rough matte for a moving subject shot in front of a static background, for example. However, because of lighting discrepancies, grain, and tiny movements of the camera or background, you may need to use other nodes to refine the results.

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | A               | The background without the subject (a clean plate). |
|                 | B               | The subject with the background.                    |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                |
|----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------|
| Difference Tab |                  |               |                                                                                                                         |
| offset         | offset           | 0             | Subtract this value from each pixel of the output.                                                                      |
| gain           | gain             | 1             | Any pixels that are white are set to this color.                                                                        |
| output         | output           | enabled       | Enables the associated output channel to the right. Disabling this checkbox is the same as setting the channel to none. |
|                |                  | rgba.alpha    | Render the resulting image into this output channel.                                                                    |

## Encryptomatte

Encryptomatte creates new mattes that can be added to an existing set of Cryptomatte-encoded mattes in Nuke.

See [Cryptomatte](#) for more information.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                      |
|-----------------|-----------------|---------------------------------------------------------------|
| Input           | Matte           | The source of the matte to add to the existing set of mattes. |
|                 | unnamed         | The image sequence containing the object or material passes.  |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                     |
|-------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Encryptomatte Tab |                  |               |                                                                                                                                                                                                                                                                                                              |
| Matte Name        | matteNameType    | auto          | Sets how the incoming matte is named when added to the existing set of mattes: <ul style="list-style-type: none"> <li>• <b>auto</b> - the name of the matte source node is used. For example, <b>Roto1</b>.</li> <li>• <b>manual</b> - enter the matte name manually using the matteName control.</li> </ul> |
|                   | matteName        |               | When <b>Matte Name</b> is set to manual, enter the name for the new matte here.                                                                                                                                                                                                                              |
| Merge Operation   | mergeOperation   | over          | Sets the compositing mode that controls how the new matte is merged with the existing set. <p>The new matte behaves in the same way as the A input of a standard Merge node and the existing matte set behaves in the same way as the B input.</p>                                                           |
| Cryptomatte Layer | n/a              | none          | Sets the layer to which the new matte is added. You can also select <b>none</b> to have the matte added separately or <b>new</b> to add the matte to new layer.                                                                                                                                              |
| Export            |                  |               |                                                                                                                                                                                                                                                                                                              |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                  |
|--------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------|
| Export Write | exportWrite      | n/a           | Click to add a Write node to the Node Graph with the correct settings to render <b>.exr</b> files containing your mattes. |

# HueKeyer

This node is a chroma keyer. It calculates hue from the incoming red, green, and blue channels, and uses the **amount** curve to determine the value to output in the alpha channel. In the graph, the x axis represents hue and the y axis the alpha value for that hue. To key out a particular hue, find the hue on the x axis and **Ctrl/Cmd+Alt**+click to create a point on the curve at that location. Then drag the point up to a value of 1 on the y axis to set that hue to black in the alpha channel.

## Inputs and Controls

| Connection Type | Connection Name | Function                   |
|-----------------|-----------------|----------------------------|
| Input           | unnamed         | The image sequence to key. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                              |
|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HueKeyer Tab |                  |               |                                                                                                                                                                                                                       |
| channels     | channels         | rgb           | The hue is calculated from these channels.                                                                                                                                                                            |
| lut          | lut              | N/A           | Use the amount curve to control the amount of alpha that is output from the hue. With the <b>sat_thrsh</b> curve you can adjust the saturation threshold. Increase this threshold to reject hues with low saturation. |
| output       | output           | enabled       | Enables the associated output channel to the right. Disabling this checkbox is the same as setting the channel to none.                                                                                               |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                            |
|--------------|------------------|---------------|---------------------------------------------------------------------|
|              |                  | rgba.alpha    | Render the resulting image into this output channel.                |
| invert       | invert           | enabled       | Inverts the use of the alpha channel so that the result is a matte. |

# IBKColor

The IBK keyer differs from many other keyers in that, instead of using a single color picker, it uses an input image (a clean plate with just the color variations of the background) to drive the key. This generally gives you good results when working with uneven blue- or greenscreens.

The IBK keyer consists of two nodes: IBKColor and [IBKGizmo](#). IBKColor creates the clean plate from the blue- or greenscreen image, and IBKGizmo pulls the key.

**Note:** Pre-rendering output from IBKColor to some formats can result in loss of color information and incorrect results when the image is used as input to IBKGizmo. We recommended that the **.exr** format is used for pre-rendered images as it supports full float data, reducing loss of information.

As a general workflow guide:

1. Connect the output from IBKColor to the **c** input of IBKGizmo.
2. Attach the input of IBKColor, along with the **fg** input of IBKGizmo, to the original blue- or greenscreen image.
3. Attach the **bg** input of IBKGizmo to your background image.
4. Create two Viewers and view the output from both nodes side-by-side.
5. Adjust the controls of IBKColor until you get a clean plate with nothing but the background colors.
6. Adjust the controls of IBKGizmo until you are happy with the key.
7. Connect the output from IBKGizmo to a compositing node, such as Merge, to composite the foreground over the background.

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | 1               | The blue- or greenscreen image.                     |
| Output          | unnamed         | Connect this to the IBKGizmo node's <b>c</b> input. |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

The <b>erode</b> and <b>patchblack</b> sliders should be set to 0 when you're adjusting these values.</p> <p>As a rule of thumb, if you have a dark green discolored area, increase <b>darks g</b>. Similarly, if you have a light red</p>                                                      |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                      |
|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | discolored area, increase the <b>lights r</b> value.                                                                                                                                                                                                                                          |
| erode        | erode            | 0             | Increase this value if you still see traces of the foreground edge color in the output. This might be especially useful if, after adjusting the lights and the darks values, you're still left with areas of discoloration. This is likely if your screen does not have a very saturated hue. |
| patch black  | multi            | 0             | After adjusting the darks and the lights, you can increase this value to remove all the black from the output image, if you want. This might be useful, for example, if you get blue/green artifacts in your composite.                                                                       |

# IBKGizmo

The IBK keyer differs from many other keyers in that, instead of using a single color picker, it uses an input image (a clean plate with just the color variations of the background) to drive the key. This generally gives you good results when working with uneven blue- or greenscreens.

The IBK keyer consists of two nodes: [IBKColor](#) and IBKGizmo. IBKColor creates the clean plate from the blue- or greenscreen image, and IBKGizmo pulls the key.

**Note:** The output from IBKGizmo is a premultiplied image with an alpha channel - it does not composite the foreground over the background. To perform the composite, connect IBKGizmo to a compositing node, such as Merge.

**Note:** Pre-rendering output from IBKColor to some formats can result in loss of color information and incorrect results when the image is used as input to IBKGizmo. We recommended that the **.exr** format is used for pre-rendered images as it supports full float data, reducing loss of information.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | bg              | The background image. This is used in calculating fine edge detail.                                                                                                                                                                                                                                                                                                                                                                            |
|                 | c               | Either: <ul style="list-style-type: none"> <li>• An IBKColor node. This creates the clean plate (that is, takes the color that is keyed out and creates a smoother representation of that).</li> <li>• A clean plate that was shot on location. This is more accurate than using an IBKColor node, but in most cases a clean plate isn't available.</li> </ul> If you have set <b>screen type</b> to <b>pick</b> , you do not need this input. |
|                 | fg              | The blue- or greenscreen image.                                                                                                                                                                                                                                                                                                                                                                                                                |

|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IBK Tab      |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| screen type  | st               | C-blue        | Set this according to the screen type in your foreground image: <ul style="list-style-type: none"> <li>• <b>C-blue</b> - select this if your foreground image is a bluescreen image and you want to use the <b>c</b> input (a clean plate) to drive the key.</li> <li>• <b>C-green</b> - select this if your foreground image is a greenscreen image and you want to use the <b>c</b> input (a clean plate) to drive the key.</li> <li>• <b>pick</b> - use the color picker below to replace the c input with a single color. This way, the IBK acts more like a traditional keyer, such as <a href="#">Primatte</a>.</li> </ul> |

| Control (UI)      | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| color             | color             | 0, 0, 1       | If you've set <b>screen type</b> to <b>pick</b> , use this control to pick a color that best represents the area you are trying to key.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| red weight        | red_weight        | 0.5           | <p>Sets how the red channel is weighted in the keying calculation. This affects the hardness of the matte in primarily red areas.</p> <p>If you check <b>screen subtraction</b> and view the output, you often see discolored edges because the background hasn't been fully removed from the original plate. This is not spill but the result of the matte being too strong. Lowering one of the weights will correct the edge of the foreground object in that color. For example, if a red foreground object has an edge problem, you should lower the <b>red weight</b>. This may affect other edges, so it's often a good idea to use multiple IBKGizmos with different weights split with Keymix nodes (<b>Merge &gt; Keymix</b>).</p> |
| blue/green weight | blue_green_weight | 0.5           | <p>Sets how the blue or green channel is weighted in the keying calculation. This affects the hardness of the matte in primarily blue or green areas.</p> <p>If you're using a bluescreen, this controls the green weight.</p> <p>If you're using a greenscreen, this controls the blue weight.</p> <p>If your foreground and background are opposite extremes in color (for example, yellow on saturated blue), you need to take the weight all the way down, making everything transparent.</p>                                                                                                                                                                                                                                            |
| luminance match   | lm_enable         | disabled      | <p>Adds a luminance factor to the keying and helps to capture transparent foreground areas that are brighter than the background.</p> <p>You can also use <b>luminance match</b> to lessen some of the</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| autolevels      | autolevels       | disabled      | <p>Can be used to reduce any hard edges from a foreground object with saturated colors. The same can be achieved with the <b>weights</b>, but the autolevels control affects only the saturated colors whereas the weights affect the entire image.</p> <p>When using this control, it's best to have this as a separate node that you can then split with other IBKGizmos as the weights controls will no longer work as expected.</p> <p>If you actually have foreground colors you want to keep, you can check the equivalent color box to keep them. For example, you may have a saturated red subject against a bluescreen, which results in a magenta transition area. Autolevels eliminates this. However, if you have a magenta foreground object, autolevels makes the magenta more red. To keep the magenta, you need to check the <b>magenta</b> box.</p> |

# Keyer

This node gives you access to several simple keyers. You can use it to pull keys based on the input image's:

- red, green, or blue channel,
- redscreen, greenscreen, or bluescreen,
- luminance (the default),
- saturation, or
- maximum and minimum values.

To use this node, view the alpha channel in the Viewer. Then, use the **range** graph to adjust the low and high pixel values of the matte. The **A** handle determines the low or transparent values of the key: any pixels that fall below this value are clipped to black. The **B** handle determines your high or opaque values: pixel values above this setting are clipped to white.

The default positions let you control the low and high values, assuming your image has distinct light and dark areas. However, sometimes the subject of the matte falls into the "middle-gray" area; the **C** and **D** handles let you shift the center for the high values of the key.

## Inputs and Controls

| Connection Type | Connection Name | Function                   |
|-----------------|-----------------|----------------------------|
| Input           | unnamed         | The image sequence to key. |

| range        | range            | N/A           | Drag the <b>A</b> , <b>B</b> , <b>C</b> , and <b>D</b> delimiter handles in the graph to adjust your keying result. The <b>A</b> delimiter marks the value where you want the keying to start, the distance between <b>B</b> and <b>C</b> mark the length of the full effect and delimiter <b>D</b> indicates where the effect stops. |
| A            | range            | 1             | Enter the value for delimiter <b>A</b> in the <b>range</b> graph. You can also drag the handle in the graph.                                                                                                                                                                                                                          |
| B            | range            | 1             | Enter the value for delimiter <b>B</b> in the <b>range</b> graph. You can also drag the handle in the graph.                                                                                                                                                                                                                          |
| C            | range            | 1             | Enter the value for delimiter <b>C</b> in the <b>range</b> graph. You can also drag the handle in the graph.                                                                                                                                                                                                                          |
| D            | range            | 1             | Enter the value for delimiter <b>D</b> in the <b>range</b> graph. You can also drag the handle in the graph.                                                                                                                                                                                                                          |

# Keylight

Keylight is an industry-proven color difference keyer. Use the **Screen Color** selector to choose a color from the **Source** input to use as the blue/green screen color and the **View** dropdown menu to judge the key. To remove blue/green spill from the foreground object, use the **Despill Bias** control to pick skin tones from the source. Use the **Screen Matte** parameters to improve the matte.

Keylight's core algorithm was developed by the Computer Film Company (now Framestore) and has been further developed by Foundry.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                            |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------|
| Input           | bg              | The background image to replace the blue/green screen in the foreground.                                            |
|                 | OutM            | The Outside Mask, or garbage matte, used to remove unwanted objects (lighting rigs, and so on) from the foreground. |
|                 | InM             | The Inside Mask, or holdout matte, used to confirm areas that are definitely foreground.                            |
|                 | Source          | The foreground image to key.                                                                                        |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

It does not include any inside or outside masks.</li> <li>• <b>Inside Mask</b> - view the inside input. This is used to firm up the foreground matte to stop print through.</li> <li>• <b>Outside Mask</b> - view the outside input. The outside mask is used as a garbage mask to reveal the background.</li> </ul> |

| Control (UI)         | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                      |                  |               | <ul style="list-style-type: none"> <li>• <b>Combined Matte</b> - view the screen matte, inside mask, and outside masks added together.</li> <li>• <b>Status</b> - view an exaggerated view of the key so that minor problems are shown clearly.</li> <li>• <b>Intermediate Result</b> - view the intermediate result. Use this option on shots that can only be keyed using several different keys on different parts of the image (multipass keying). This renders the original source image with the Screen Matte generated in this Keylight node. In Keylight nodes down the tree, you should set the Source Alpha in the Inside Mask folder to Add To Inside Mask.</li> <li>• <b>Final Result</b> - this creates a premultiplied RGBA foreground that can be composited later. There's an Unpremultiply Result checkbox you can use if you wish.</li> <li>• <b>Composite</b> - this renders the foreground composited over the background using all mattes, spill and color corrections.</li> </ul> |
| Unpremultiply Result | unPreMultiply    | enabled       | When disabled, the key result is not unpremultiplied. If you're using premultiplied images, you should leave this enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Screen Color         | screenColor      | 0, 0, 0       | Sets the screen color to become transparent, usually blue or green background.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Screen Gain          | screenGain       | 1             | Adjusts how much of the screen color is removed to make the screen matte. Increasing this value keys more.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Screen Balance       | screenBalance    | 0.5           | Sets the balance point for the image to key. Generally speaking, blue screens tend to work best with a balance of around 0.95 and green screens with a balance of around 0.5. If the key is                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Control (UI)               | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                            |                  |               | not working too well with these settings, try setting the balance to about 0.05, 0.5 and 0.95 and see what works best.                                                                                                                                                                                                                                                               |
| Alpha Bias                 | alphaBias        | 0.5, 0.5, 0.5 | Adjusts the <b>AlphaBias</b> in case your screen color isn't purely blue or green and is causing parts of the foreground image to become transparent. Pick the color from the part of the foreground that is affected.                                                                                                                                                               |
| Despill Bias               | despillBias      | 0.5, 0.5, 0.5 | Adjusts the <b>DespillBias</b> to remove any remaining spill from around the foreground image. The most useful colors to pick for Despill Bias are often hair colors and skin tones.<br><br><div> <b>Note:</b> This control is disabled unless <b>Use Alpha Bias for Despill</b> is disabled.</div> |
| Use Alpha Bias for Despill | gangBiases       | enabled       | When enabled, use the <b>AlphaBias</b> color as the <b>DespillBias</b> color.<br><br>When disabled, set the <b>DespillBias</b> color separately.                                                                                                                                                                                                                                     |
| Screen PreBlur             | preBlur          | 0             | Adjusts how much you want to soften the foreground image used to generate the key. If you're keying digital video or grainy footage, you might get better results if you adjust this control slightly.                                                                                                                                                                               |
| Screen Matte               |                  |               |                                                                                                                                                                                                                                                                                                                                                                                      |
| Clip Black                 | screenClipMin    | 0             | Sets the cut off point below which alpha values in the Screen Matte are set to zero.                                                                                                                                                                                                                                                                                                 |

| Control (UI)        | Knob (Scripting)   | Default Value | Function                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|--------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     |                    |               |  <b>Note:</b> Adjusting this control too aggressively can cause hard edges between the foreground and background.                                                                                                                                                            |
| Clip White          | screenClipMax      | 1             | Sets the cut off point above which alpha values in the Screen Matte are set to the white point.<br><br> <b>Note:</b> Adjusting this control too aggressively can cause hard edges between the foreground and background.                                                     |
| Clip Rollback       | screenClipRollback | 0             | Allows edge detail to be restored after clipping the Screen Matte too aggressively using the <b>ClipBlack</b> and <b>ClipWhite</b> controls.                                                                                                                                                                                                                  |
| Screen Dilate       | screenGrowShrink   | 0             | Adjusts alpha values in the Screen Matte. Either grow (if greater than zero) or shrink (if less than zero) the alpha in the Screen Matte at a sub-pixel level.<br><br> <b>Note:</b> This control should not normally be used as eroding edges can produce a very poor key. |
| Screen Softness     | screenSoftness     | 0             | Controls the amount of blur applied to the matte. For example, softness could be used on a very harsh matte pulled for use as an inside matte further down the tree.                                                                                                                                                                                          |
| Screen Despot Black | screenDespotBlack  | 0             | Removes isolated spots of black in a white matte by simplifying the matte. Black specks in the white matte are absorbed by the surrounding white areas.                                                                                                                                                                                                       |

| Control (UI)         | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# Primatte

Primatte keys are created incrementally by sampling single pixels, or a range of pixels, from a blue or greenscreen image. This controls the polyhedron in colorspace that determines what pixels are in or outside the matte. To use Primatte, click **Auto-Compute** to automatically sense the backing screen color, eliminate it, and even get rid of some of the foreground and background noise. Alternatively, you can set **operation** to how you want to use the color samples, or use the left and right arrow buttons to step through all the operations. Then, use **Ctrl**+click or **Ctrl**+**Shift**+drag to select a single color or a range of colors from the Viewer. Primatte then uses these to adjust the polyhedron. Nuke provides unlimited Undo during this process.

Primatte is a trademark of IMAGICA Corp. Primatte patent is held by IMAGICA Corp.

|              |                  |               | dragging its edges.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                |
|              | mask             | none          | The channel to use as a mask. By default, the Primatte effect is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel so that the Primatte effect is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Initialize   |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| algorithm    | algorithm        | Primatte      | <p>Choose which algorithm Primatte uses to calculate your keying result:</p> <ul style="list-style-type: none"> <li>• <b>Primatte</b> - The Primatte algorithm delivers the best results and supports both the solid color and the complement color spill suppression methods. It is the algorithm that uses three multi-faceted polyhedrons (as described further down in the this chapter) to separate the 3D RGB colorspace. It is also the default algorithm mode and, because it is computationally intensive, it may take longer to render.</li> </ul> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | <ul style="list-style-type: none"> <li>• <b>PrimatteRT</b> - is the simplest algorithm and therefore, the fastest. It uses only a single planar surface to separate the 3D RGB colorspace (as described further down in this chapter) and, as a result, does not have the ability to separate out the foreground from the backing screen as carefully as the above <b>Primatte</b> algorithm. Other disadvantages of the <b>Primatte RT</b> algorithm is that it does not work well with less saturated backing screen colors and it does not support the complement color spill suppression method.</li> <li>• <b>Primatte RT+</b> - this is in between the above two options. It uses a six planar surface color separation algorithm (as described further down in this document) and delivers results in between the other two in both quality and performance. Other disadvantages of the <b>Primatte RT+</b> algorithm is that it does not work well with less saturated backing screen colors and it does not support the complement color spill suppression method.</li> </ul> |
| Reset        | Reset            | N/A           | Resets all of the Primatte properties to their initial values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Auto-Compute | Auto-Compute     | N/A           | This can be used as the first step in the Primatte operation. Its purpose is to automatically detect the backing screen color, remove it, and do some clean-up on the foreground and background noise. If the clip was shot with an evenly lit, well-saturated backing screen, the <b>Auto-Compute</b> button leaves you with an image that may only need some spill removal to complete your keying operation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| viewer       | viewer           | disabled      | Opens a Primatte Viewer that displays a graphical representation of the Primatte algorithms and allows you to see what is happening as the various Primatte tools are used. It is a passive feature that has no                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                                                                                     |                  |               | <ul style="list-style-type: none"> <li>• <b>Detail(+)</b> - increases foreground detail for the sampled pixel color (and all colors like it) in the amount of one Primatte increment. If there is still too much detail, another click using this operational mode tool makes more of it disappear. This can be used to remove smoke or wisps of hair from the composite. Sample where detail is visible and it disappears. This is for moving color regions into the 100% background region. It can be used to nullify a <b>Detail (-)</b> step.</li> <li>• <b>Fine Tuning Sliders</b> - provides finer control over the removal of spilled background color. The color of the sampled pixel is registered as a reference color for fine tuning. To perform the tuning operation, select a Fine Tuning slider and move it to achieve the desired effect.</li> <li>• <b>3D Sample</b> - When viewer is enabled in the Primatte properties, the sampled colors are displayed as a spray of white pixels in the Primatte Viewer. This allows you to see where the selected backing screen colors reside within the 3D RGB colorspace.</li> <li>• <b>Simple Select BG Color</b> - gets the sampled backing screen color, projecting a line in the opposite direction on the hue wheel and generating artificial pixels that may represent the FG object. Then, using the artificially generated foreground pixels, it performs a Clean FG Noise operation internally and renders the composite image.</li> </ul> |
|  | currentColor     | black         | To sample colors from the Viewer, make sure this is pushed in (displaying an eyedropper), then <b>Ctrl/Cmd</b> +click in the Viewer to pick single pixels, or <b>Ctrl/Cmd</b> + <b>Shift</b> +drag to pick a rectangle of pixels.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

This means you need to add a Colorspace node after both Primatte and your original background image to convert their colorspace to sRGB, then do your color corrections or transforms, merge the images together, and, finally, use another Colorspace node to convert the result back to linear.</li> </ul>                                                                           |
| output mode (continued) |                  |               | <ul style="list-style-type: none"> <li>• <b>notpremultiplied</b> - outputs the original foreground pixels (instead of the result of the Primatte node), along with the calculated matte.</li> <li>• <b>adjust lighting FG</b> - outputs the light-adjusted foreground that the adjust lighting mode creates (this has a more even shade of the backing color with the foreground object). If adjust lighting is disabled, this option simply displays the un-optimized, original foreground image.</li> <li>• <b>adjust lighting BG</b> - outputs the optimized artificial backing screen that the adjust lighting mode creates (a clean backing screen that has no foreground object).</li> <li>• <b>hybrid core</b> - outputs the internally generated core matte, used when hybrid render is enabled.</li> <li>• <b>hybrid edge</b> - outputs the internally generated edge matte, used when hybrid render is enabled.</li> </ul> |
| output                  | output           | rgba          | The channels to write the output image to.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

# Ultimatte

Ultimatte AdvantEdge technology is a color difference keyer. It is the culmination of over 25 years of bluescreen imaging experience by Ultimatte Corporation. The final result is a composite that preserves fine details like hair, smoke, and motion blurred edges with a minimum of compromises.

As a general workflow guide:

1. Use the **screen** control in the Viewer to sample the screen (backing) color near detail that you want to retain.
2. Activate the **overlay** display and use the **overlay +** and **-** pickers to get the overlay to cover as much of the screen as possible without intruding on the foreground subject area. The overlay indicates areas that will definitely not be in the composite.
3. Turn the overlay view off, view the alpha channel, and use the **matte +** and **-** pickers to bring areas more solidly into the matte or remove noise or other aberrations from the matte.
4. Use the **hold shadow** dropper (only available when **screen correct** and **shadow** are enabled) to scrub on the shadows that you'd like to preserve. These shadows may best be seen in the foreground image. This allows the shadows to be handled separately (and more accurately) from foreground subject areas.
5. Finally, you can use the **spill** and **match** pickers to improve the color correction applied to the RGB channels.

Ultimatte is a trademark of Ultimatte Corporation. Ultimatte patent is held by Ultimatte Corporation.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                   |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | hm              | The holdout matte used to confirm areas that are definitely foreground.<br><br>At first, the holdout mask input appears as triangle on the left side of the node, but when you drag it, it turns into an arrow labeled hm. |
|                 | gm              | The garbage matte used to remove unwanted objects (lighting rigs, and so on) from the foreground.                                                                                                                          |

| Connection Type | Connection Name | Function                                                                             |
|-----------------|-----------------|--------------------------------------------------------------------------------------|
|                 | bg              | The background, or screen, image to replace the blue/green screen in the foreground. |
|                 | cp              | An optional clean plate input.                                                       |
|                 | fg              | The foreground, or subject, image to key.                                            |

| Control (UI)      | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                                   |
|-------------------|-------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ultimatte Tab     |                   |               |                                                                                                                                                                                                                                                                                                                            |
| screen color      | screen_color      | 0             | Sets the primary color on which the screen extraction is based. Choose an area on the blue/green screen near important subject detail that is not obscured in any way.                                                                                                                                                     |

# Merge Nodes

Merge nodes deal with layering multiple images together. The default mode is **over**, which simply places one image on top of another.

## Absminus

Absminus is the same as the [Merge](#) node, only with **operation** set to **difference** by default. It layers images together using the **difference** compositing algorithm: **abs(A-B)**. This algorithm calculates how much the pixels in input **A** differ from the pixels in input **B**. It can be useful for comparing two very similar images.

See also [Merge](#).

## AddMix

Using AddMix, the alpha of input **A** is used to index two color correction lookup curves (LUTs). The first is used to multiply input **A**, the second to multiply input **B**, and the results are added together. AddMix performs a similar operation to the Merge node's **over** mode, but also premultiplies your image. If you have a CG image that has been rendered, you're probably better off not using AddMix because you might lose detail by having your image premultiplied twice.

AddMix can be useful if your input contains a mask that covers a specific area and you want to only merge in that particular area, for instance if you have rotoscoped a particular shape and want to mix it using the roto shape as an alpha.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | A               | The first input sequence to mix (must include an alpha channel).                                                                                                                                                                                                                                                                                                   |
|                 | B               | The second input sequence to mix.                                                                                                                                                                                                                                                                                                                                  |
|                 | mask            | <p>An optional image to use as a mask. By default, merge is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                        |
|---------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| AddMix Tab    |                  |               |                                                                                                                                                 |
| A             | A                | rgba          | <p>Select the channels to use on the A input.</p> <p>You can use the checkboxes on the right to select individual channels.</p>                 |
| B             | B                | rgba          | <p>Select the channels to use on the B input.</p> <p>You can use the checkboxes on the right to select individual channels.</p>                 |
| output        | output           | rgba          | <p>Render into selected output channels.</p> <p>You can use the checkboxes on the right to select individual channels.</p>                      |
| premultiplied | premultiplied    | Disabled      | Compensate for the A input being premultiplied. Colors in the A input are divided by their alpha before being multiplied by the A lookup curve. |
| nonlinear     | nonlinear        | Disabled      | Remap the zero to infinity range down into 0-1                                                                                                  |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                     |
|----------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |               | logarithmically, so as to fit high dynamic range image details into the lookup curve range. This may improve results when merging high dynamic range images. |
| [A and B LUTs] | lut              | N/A           | View and adjust the color lookup curves for A and B inputs.                                                                                                  |
| reset          | N/A              | N/A           | Reset the A and B LUT curves back to the original values.                                                                                                    |
| mix            | mix              | 1             | Dissolve between the B input only and the merged result.                                                                                                     |

# Blend

Lets you blend images together by creating the weighted average of all of the inputs. You can continue to add more inputs, and more weight parameters will be added accordingly. This allows you to easily average together three, four, or more images and adjust how much each contributes to the result.

This node is particularly useful if you have multiple images to combine, allowing you to specify the amount to mix them by for each image. It is similar to using the [Merge](#) node, except if you wanted to merge more than two images with Merge nodes, you would have to chain multiple nodes.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | numbered inputs | The images you want to average together. Connect a minimum of two images to the numbered inputs.                                                                                                                                                                                                                                                                              |
|                 | mask            | <p>An optional image to use as a mask. By default, the blend effect is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                    |
|----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Blend Tab      |                  |               |                                                                                                                                                                                                             |
| channels       | channels         | all           | <p>The blend effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> |
| [input number] | weight0          | 1             | The weight of each of the numbered inputs. The larger the value, the more the input in question contributes to the result.                                                                                  |
| normalize      | weight1          | enabled       | When enabled, the inputs are summed up and each of them divided by the total, so that the total doesn't exceed 1.0. This could help you avoid overexposed areas.                                            |
| mask           | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                               |
|                | maskChannelInput | none          | The channel to use as a mask. By default, the blend effect is limited to the non-black areas of this channel.                                                                                               |
| inject         | inject           | disabled      | Copies the mask input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                       |
| invert         | invert_mask      | disabled      | Inverts the use of the mask channel so that the blend effect is limited to the non-white areas of the mask.                                                                                                 |
| fringe         | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.                                                                                                                                                |
|                |                  |               | When disabled, the effect is applied to the entire mask.                                                                                                                                                    |

# ContactSheet

Generates a contact sheet that shows the different inputs or the frames of one input lined up next to each other. This can help you demonstrate, document, or manage what you are doing for a project.

See also [LayerContactSheet](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | numbered inputs | The images you want to appear on the Contact Sheet. |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                              |
|------------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ContactSheet Tab |                  |               |                                                                                                                                                                                                                       |
| Resolution       | width            | 3072          | Defines the size of the Contact Sheet in pixels.                                                                                                                                                                      |
|                  | height           | 2048          |                                                                                                                                                                                                                       |
| rows/columns     | rows             | 3             | Defines the number of rows and columns in the Contact Sheet.                                                                                                                                                          |
|                  | columns          | 4             |                                                                                                                                                                                                                       |
| gap              | gap              | 0             | Sets the gap, in pixels, around each input or frame.                                                                                                                                                                  |
| center           | center           | disabled      | When enabled, the input images are arranged so that the specified number of rows are centered vertically within the <b>Resolution</b> bounds.                                                                         |
| Row Order        | roworder         | BottomTop     | Sets the row display order: <ul style="list-style-type: none"> <li>• <b>TopBottom</b> - rows are populated from the top downward.</li> <li>• <b>BottomTop</b> - rows are populated from the bottom upward.</li> </ul> |

| Control (UI)                 | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                      |

| Use frames instead of inputs | splitinputs      | disabled      | When enabled, the <b>FrameRange</b> specified is read from each input and displayed in the Contact Sheet.<br><br>For example, with 4 inputs and <b>FrameRange</b> set to 1-2, you'd see 8 plates displayed in the Contact Sheet (2 frames from each input).                                                                   |
| Frame Range                  | startframe       | -1            | Sets the frame range to extract from each input when <b>Use frames instead of inputs</b> is enabled.                                                                                                                                                                                                                          |
|                              | endframe         | -1            |                                                                                                                                                                                                                                                                                                                               |

# CopyBBox

Copies the bounding box from the **A** input onto the **B** stream. The bounding box defines the area of the frame that Nuke sees as having valid image data. The larger the bounding box is, the longer it takes Nuke to process and render the images.

Some Nuke operations, such as a merge, can cause an expansion of the bounding box area because Nuke does not know that the extra area is going to be black or another constant color. Often, you can fix this by copying the bounding box from one of the inputs to the resulting image, thus cutting off the extra area.

See also [AdjustBBox](#).

# CopyRectangle

With the CopyRectangle node, you can copy a rectangular area from one input on top of another.

The CopyRectangle node can also be used to limit effects, such as color corrections, to a small rectangular region of an image. To do so, you need to use the same image in both input **A** and **B** and only perform the color correction on one input.

## Inputs and Controls

| Connection Type | Connection Name | Function                                      |
|-----------------|-----------------|-----------------------------------------------|
| Input           | A               | The image from which the rectangle is copied. |
|                 | B               | The image to which the rectangle is copied.   |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                       |
|-------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| channels          | channels         | all           | <p>Sets the channels to copy from input A within the specified rectangle.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> |
| area xyrt         | area             | 512           | Sets the bounds of the copy rectangle on the xy axes and the rectangle position from the right and top.                                                                                                                        |
|                   |                  | 389           |                                                                                                                                                                                                                                |
|                   |                  | 1536          |                                                                                                                                                                                                                                |
|                   |                  | 1167          |                                                                                                                                                                                                                                |
| softness          | softness         | 0             | <p>Allows you to vignette the edges of the copied rectangle. The larger the value, the more of the area around the edges is faded to input B.</p> <p>A value of 0 produces no vignetting.</p>                                  |
| mix               | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                                                                                                                            |

# Dissolve

Dissolve creates a weighted average of two inputs.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | 0-9999          | The image sequences to mix between.                                                                                                                                                                                                                                                                                                                                              |
|                 | mask            | <p>An optional image to use as a mask. By default, the dissolve effect is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                       |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| channels     | channels         | all           | <p>The dissolve effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p>                                                                                                 |
| which        | which            | 0             | <p>Select the inputs to dissolve between.</p> <p>Set this to an integer (whole number) to show that input, or a fractional value to dissolve between the two nearest inputs. For example, if you set this to 3, Nuke displays input 3. If you set this to 3.5, Nuke displays a mix between inputs 3 and 4.</p> |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right.                                                                                                                                                                                                                                                              |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                     |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                  |
|              | maskChannelInput | none          | The channel to use as a mask. By default, the dissolve is limited to the non-black areas of this channel.                                    |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream. |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel so that the dissolve is limited to the non-white areas of the mask.                                      |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask.                 |

# In

In is the same as the [Merge](#) node, only with **operation** set to **in** by default. It layers images together using the **in** compositing algorithm: **Ab**. This algorithm only shows the areas of image **A** that overlap with the alpha of **B**. It can be useful for combining mattes.

See also [Merge](#).

# Keymix

Keymix layers two images together using a specified Roto shape or image as a mask. It copies input **A** to input **B** where the **mask** is non-black. This follows the formula **Aa + B(1-a)**. It is similar to the Over node, but for use with unpremultiplied images. The resulting image contains no alpha channel.

See also **Over** within the [Merge](#) node table.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                      |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | A               | The image sequence to merge with input <b>B</b> . By default, this input is copied to input <b>B</b> only where the <b>mask</b> is non-black. |
|                 | B               | The image sequence to merge with input <b>A</b> .                                                                                             |
|                 | mask            | The image to use as a mask. By default, the effect of input <b>A</b> is limited to the non-black areas of the mask.                           |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                               |

| mask channel | N/A              | enabled       | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                          |
|              | maskChannel      | rgba.alpha    | The channel to use as a mask. By default, the effect of input <b>A</b> is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                                                              |
| invert       | invertMask       | disabled      | Inverts the use of the mask channel so that the effect of input <b>A</b> is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                |
| mix          | mix              | 1             | Dissolves between the original <b>B</b> input at 0 and the full Keymix effect at 1.                                                                                                                                                                                                                                                                                                                                    |
| Set BBox to  | bbox             | union         | How to output the bounding box: <ul style="list-style-type: none"> <li>• <b>union</b> - combine the two bounding boxes.</li> <li>• <b>B side</b> - use the bounding box from input <b>B</b>. Any data from the <b>A</b> input that's outside this box is clipped.</li> <li>• <b>A side</b> - use the bounding box from input <b>A</b>. Any data from the <b>B</b> input that's outside this box is clipped.</li> </ul> |

# LayerContactSheet

Generates a contact sheet that shows all the layers in the input lined up next to each other. This can help you demonstrate, document, or manage what you are doing for a project.

See also [ContactSheet](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | numbered inputs | The images you want to appear on the Contact Sheet. |

| Control (UI)           | Knob (Scripting) | Default Value | Function                                                                                                                                      |
|------------------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| LayerContactSheet Tab  |                  |               |                                                                                                                                               |
| Resolution             | width            | 3072          | Defines the size of the Contact Sheet in pixels.                                                                                              |
|                        | height           | 2048          |                                                                                                                                               |
| rows/columns           | rows             | 3             | Defines the number of rows and columns in the Contact Sheet when <b>automatic rows/columns</b> is disabled.                                   |
|                        | columns          | 4             |                                                                                                                                               |
| automatic rows/columns | autodims         | enabled       | When enabled, the number of rows and columns is auto-calculated.                                                                              |
| gap                    | gap              | 0             | Sets the gap, in pixels, around each input.                                                                                                   |
| center                 | center           | disabled      | When enabled, the input images are arranged so that the specified number of rows are centered vertically within the <b>Resolution</b> bounds. |
| Row Order              | roworder         | BottomTop     | Sets the row display order: <ul style="list-style-type: none"> <li>• <b>BottomTop</b> - rows are populated from the bottom upward.</li> </ul> |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                |
|------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  |                  |               | <ul style="list-style-type: none"> <li>• <b>TopBottom</b> - rows are populated from the top downward.</li> </ul>                                                                                                        |
| Column Order     | colorder         | LeftRight     | Sets the column display order: <ul style="list-style-type: none"> <li>• <b>LeftRight</b> - columns are populated from left to right.</li> <li>• <b>RightLeft</b> - columns are populated from right to left.</li> </ul> |
| Show layer names | showLayerNames   | disabled      | When enabled, the layers on the Contact Sheet are labeled with the associated channel name.                                                                                                                             |

# Matte

Matte is the same as the [Merge](#) node, only with **operation** set to **matte** by default. It layers images together using the **matte** compositing algorithm:  **$Aa + B(1-a)$** . This algorithm is the same as a premultiplied **over**. You should use unpremultiplied images with this operation.

# Max

Max is the same as the [Merge](#) node, only with **operation** set to **max** by default. It layers images together using the **max** compositing algorithm:  **$\max(A,B)$** . This algorithm outputs the maximum value for each channel of each pixel. It can be useful for combining mattes and bringing aspects like bright hair detail through.

# Merge

Merge allows you to layer multiple images together. When using this node, you need to select a compositing algorithm that determines how the pixel values from one input are calculated with the pixel values from the

other to create the new pixel values that are output as the merged image. The **operation** dropdown menu houses a large number of different compositing algorithms, giving you great flexibility when building your composite.

When using most of the available merge algorithms, Nuke expects premultiplied input images. However, with the **matte** operation you should use unpremultiplied images.

You can also create this node by pressing **M** on the Node Graph.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | A               | The image sequence to merge with input B. When you connect the A input, a new input A1, A2, etc. is spawned allowing you to connect multiple image.                                                                                                                                                                                                                       |
|                 | B               | The image sequence to merge with input A.                                                                                                                                                                                                                                                                                                                                 |
|                 | mask            | <p>An optional image to use as a mask. By default, the merge is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control isn't disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                     |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
|              | maskChannelInput | none          | The channel to use as a mask. By default, the merge is limited to the non-black areas of this channel.                                       |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream. |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel, so that the merge is limited to the non-white areas of the mask.                                        |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask.                 |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full merge at 1.                                                                           |

# MergeExpression

Allows you to merge two images using Tcl expressions. The syntax is the same as for the **Color > Math > Expression** node, except that you need to precede channel references with either **A** or **B** to indicate the input. For example, to reference the red, green, blue, and alpha channels of input **A**, you should use **Ar**, **Ag**, **Ab**, and **Aa**. Similarly, to reference these channels in input **B**, use **Br**, **Bg**, **Bb**, and **Ba**.

To reference pixels in other layers, use **INPUTlayer.channel**, for example **Bmatte.garbage**. If you don't specify a layer, Nuke assumes the channel is in the current layer, for example **Bgarbage**.

For more information on the syntax for Tcl expressions, see Nuke's [online help](#) in the Nuke or select **Help > Documentation > Knob Math Expressions** in Nuke.

See also [Expression](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | A               | The image sequence to merge with input B.                                                                                                                                                                                                                                                                                                                                 |
|                 | B               | The image sequence to merge with input A.                                                                                                                                                                                                                                                                                                                                 |
|                 | mask            | <p>An optional image to use as a mask. By default, the merge is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control isn't disabled or set to <b>none</b>.</p> |

| Control (UI)          | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                       |

|----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mask           | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                     |
|                | maskChannelInput | none          | The channel to use as a mask. By default, the merge is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                                                                            |
| inject         | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                                                                      |
| invert         | invert_mask      | disabled      | Inverts the use of the mask channel, so that the merge is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                             |
| fringe         | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.                                                                                                                                                                                                                                                                                                                                                      |
|                |                  |               | When disabled, the effect is applied to the entire mask.                                                                                                                                                                                                                                                                                                                                                          |
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                          |
|                | unpremult        | none          | <p>The image is divided by this channel before being processed, and multiplied again afterwards.</p> <p>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate doing the merge before the premultiplication was done.</p> <p>If you are using unpremultiplied input images, you should leave this set to <b>none</b>.</p> |
| invert         | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                   |
| mix            | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                                                                                                                                                                                                                                                                                                               |

# Min

Min is the same as the [Merge](#) node, only with **operation** set to **min** by default. It layers images together using the **min** compositing algorithm: **min(A,B)**. This algorithm outputs the minimum value for each channel of each pixel.

See also [Merge](#).

# Multiply

Multiply is the same as the [Merge](#) node, only with **operation** set to **multiply** by default. It layers images together using the **multiply** compositing algorithm: **AB, A if A<0 and B<0**. This algorithm multiplies the pixel channel values but takes the value of **A** if both **A** and **B** are negative. It can be useful for compositing darker values from **A** with the image of **B** - dark gray smoke shot against a white background, for example.

It can also be used to add a grain plate to an image regrained with [F\\_ReGrain](#).

See also [Merge](#).

# Out

Out is the same as the [Merge](#) node, only with **operation** set to **out** by default. The Out node can be useful for combining mattes. It layers images together using the **out** compositing algorithm: **A(1-b)**, where **b** is the alpha value of a pixel from image **B**. This algorithm only shows the areas of image **A** that overlap areas of **B** which are rejected when using **B** in a matte.

See also [Merge](#).

# Plus

Plus is the same as the [Merge](#) node, only with **operation** set to **plus** by default. It layers images together using the **plus** compositing algorithm: **A+B**. This algorithm calculates the sum of image **A** and **B**. Note that it may result in pixel values higher than 1.0.

Plus can be useful for compositing laser beams, but you're better off not using this one for combining mattes.

# Premult

By default, Premult multiplies the input's rgb channels by its alpha (in other words, premultiplies the input image). You may need this node when:

- **Merging unpremultiplied images.** Because Merge nodes in Nuke expect premultiplied images, you should use this node before any Merge operations if your input images are unpremultiplied. This avoids unwanted artifacts, such as fringing around masked objects.
- **Color correcting premultiplied images.** When you color correct a premultiplied image, you should first connect an Unpremult node to the image to turn the image into an unpremultiplied one. Then, perform the color correction. Finally, add a Premult node to return the image to its original premultiplied state for Merge operations.

Typically, most 3D rendered images are premultiplied. As a rule of thumb, if the background is black or even just very dark, the image may be premultiplied.

See also [Unpremult](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                    |
|-----------------|-----------------|-------------------------------------------------------------|
| Input           | unnamed         | The unpremultiplied image sequence you want to premultiply. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                 |
|--------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------|
| Premult Tab  |                  |               |                                                                                                                          |
| multiply     | channels         | rgb           | The channels to multiply (usually rgb).<br><br>You can use the checkboxes on the right to select individual channels.    |
| by           | N/A              | enabled       | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> . |
|              | alpha            | rgba.alpha    | Multiply the above channels by this channel (usually alpha).                                                             |
| invert       | invert           | disabled      | Inverts the use of the alpha channel.                                                                                    |

# Screen

Screen is the same as the [Merge](#) node, only with **operation** set to **screen** by default. It layers images together using the **screen** compositing algorithm:  **$A+B-AB$  if  $A$  or  $B \leq 1$ , otherwise  $\max(A,B)$** . In other words, if **A** or **B** is less than or equal to 1, the **screen** algorithm is used, otherwise **max** is chosen. Screen resembles **plus**. It can be useful for combining mattes and adding laser beams.

See also [Merge](#).

# Switch

Lets you switch between any number of inputs. This can be useful when using gizmos.

See also [VariableSwitch](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                 |
|-----------------|-----------------|------------------------------------------|
| Input           | 0,1, 2, 3, 4... | The inputs you intend to switch between. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                      |
|--------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch Tab   |                  |               |                                                                                                                                                                                                                                                                                                               |
| which        | which            | 0             | <p>The input to display. Each input is displayed at the value corresponding to the number of the input. For example:</p> <ul style="list-style-type: none"> <li>• Setting <b>which</b> to 4 displays the image from input 4.</li> <li>• Setting <b>which</b> to 6 displays the image from input 6.</li> </ul> |

## TimeDissolve

Dissolves between two inputs, starting the dissolve at the **in** frame and ending at the **out** frame. You can specify the dissolve curve over time.

## Inputs and Controls

| Connection Type | Connection Name | Function                               |
|-----------------|-----------------|----------------------------------------|
| Input           | A               | The input you intend to dissolve from. |
|                 | B               | The input you intend to dissolve to.   |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                              |
|------------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TimeDissolve Tab |                  |               |                                                                                                                                                                                                                                       |
| in               | in               | 1             | Sets the frame to begin the dissolve over time.                                                                                                                                                                                       |
| out              | out              | 10            | Sets the frame to end the dissolve.                                                                                                                                                                                                   |
| Curves           | lut              | N/A           | Use the curve to define how the dissolve behaves in the frame range: <ul style="list-style-type: none"> <li>• <b>0</b> - the frame before the <b>in</b> frame.</li> <li>• <b>1</b> - the frame after the <b>out</b> frame.</li> </ul> |
| Reset            | N/A              | N/A           | Click to reset the curve to the default shape.                                                                                                                                                                                        |

# Unpremult

By default, this node divides the input's rgb channels by its alpha. If your input images are premultiplied, this can make color corrections more accurate.

When you color correct premultiplied images, you should first connect an Unpremult node to the image to turn the image into an unpremultiplied one. Then, apply the color correction. Finally, add a Premult node to return the image to its original premultiplied state - this last step is important if you want to merge the image over another one, as Merge nodes in Nuke expect premultiplied images.

Typically, most 3D rendered images are premultiplied. As a rule of thumb, if the background is black or even just very dark, the image may be premultiplied.

See also [Premult](#).

|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------|
| variable     | variable         | N/A           | The options in this dropdown are derived from the Variables set in the Variables tab in Project Settings. |

| Control (UI) | Knob (Scripting)               | Default Value | Function                                                                                                                                                                                                                                              |
|--------------|--------------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| patterns     | i0, i1, i2, i3, i4 (and so on) | N/A           | A pattern knob appears for each input that the node has. Type Variable names into these patterns to define the inputs that are active on the node. The Variables should match the ones you have defined in the Variables tab in the Project Settings. |

# ZMerge

Merges input images together at their appropriate 3D depths. It does this by setting each output pixel to the input with the closest Z depth value. Z depth values are usually stored in a separate depth channel (for example, **depth.z**) and determine the placing of objects within the field of view of the camera. By default, ZMerge considers smaller Z depth values (darker areas) to be closer to the camera and larger values (lighter areas) further away, but you can invert this behavior.

You can use ZMerge as an alternative to creating holdout geometry, but note that you may get poor results or have problems with anti-aliasing if your input images include transparent areas or motion blur.

See also [Deep Nodes](#).

## Inputs and Controls

| Connection Type | Connection Name   | Function                                                                                                                                                                                                                                                                                              |
|-----------------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | [numbered inputs] | <p>Images to merge together based on their Z depth values.</p> <p>Each input should include a Z depth channel describing the depth of the objects in that image. ZMerge merges the depth channels from all inputs and uses the result to determine what input each output pixel should come from.</p> |

| Control (UI)             | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                     |
|--------------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ZMerge Tab               |                  |               |                                                                                                                                                                                                                                                                              |
| Z channel                | N/A              | enabled       | Enables the associated Z channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                   |
|                          | z_channel        | depth.Z       | The channel with the Z depth values. This should be the same for each input. For example, if you are merging two inputs, both data streams should have a Z depth channel in the channel specified here.                                                                      |
| smaller Z = further away | backwards        | disabled      | <p>When enabled, darker Z values are further away and hidden by lighter Z values. This is correct for Nuke and Pixar's RenderMan renderer, which output 1/distance.</p> <p>When disabled, lighter Z values are further away and hidden by darker Z values.</p>               |
| Alpha channel            | N/A              | enabled       | Enables the associated alpha channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                               |
|                          | alpha_channel    | rgba.alpha    | When enabled, ZMerge uses the inputs' alpha channels to blend between the foreground and background. You may want to check this if your input elements have alpha channels and you have a depth map that covers the entire scene (rather than just the individual elements). |

# Transform Nodes

Transform nodes deal with translation, rotation, and scale as well as tracking, warping, and motion blur.

## AdjustBBox

The AdjustBBox node lets you expand or crop the edges of the bounding box by a specified number of pixels. The bounding box defines the area of the frame that Nuke sees as having valid image data. For example, if you have an image with lots of black (0,0,0,0), you can adjust the bounding box to contain just the useful area so that Nuke won't waste time computing results where there is no change.

### Inputs and Controls

| Connection Type | Connection Name | Function                                |
|-----------------|-----------------|-----------------------------------------|
| Input           | unnamed         | The image whose bounding box to resize. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                         |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AdjBBox Tab  |                  |               |                                                                                                                                                                                                                                                                                                                                  |
| Add Pixels   | numpixels        | 25            | <p>Adjust the width and height of the input image's bounding box by adding or removing pixels. Click the <b>2</b> button to display separate fields for width (<b>w</b>) and height (<b>h</b>).</p> <p>If you crop the bounding box, the edge pixels of the bounding box area get replicated towards the edges of the image.</p> |

# BlackOutside

The BlackOutside node fills everything outside the bounding box area with black. This removes stripes or other anomalies caused by the edge pixels of the bounding box being replicated. It may be useful, for example, after adjusting the bounding box with an [AdjustBBox](#) or [CopyBBox](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                    |
|-----------------|-----------------|-----------------------------------------------------------------------------|
| Input           | unnamed         | The image whose edges outside the bounding box you want to fill with black. |

# CameraShake

Adds simulated camera shake to a sequence using random changes in amplitude, rotation, scale, and so on. Also includes shutter controls to produce motion blur.

## Inputs and Controls

| Connection Type | Connection Name | Function                                           |
|-----------------|-----------------|----------------------------------------------------|
| Input           | unnamed         | The sequence to which the camera shake is applied. |

| motionblur     | motionblur       | 1             | <p>Sets the number of motion blur samples. A value of 1 should produce reasonable results for most sequences.</p> <p>Increase the value to produce more samples for higher quality, or decrease it to shorten the processing time. The higher the value, the smoother the result.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| shutter        | shutter          | 0.5           | <p>Enter the number of frames the shutter stays open when motion blurring. For example, a value of 0.5 corresponds to half a frame. Increasing the value produces more blur, and decreasing the value less.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| shutter offset | shutteroffset    | centered      | <p>This value controls how the shutter behaves with respect to the current frame value. It has four options:</p> <ul style="list-style-type: none"> <li>• <b>centred</b> - center the shutter around the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29,5 to 30,5.</li> <li>• <b>start</b> - open the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 30 to 31.</li> <li>• <b>end</b> - close the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29 to 30.</li> <li>• <b>custom</b> - open the shutter at the time you specify. In the field next to the dropdown menu, enter a value (in frames) you want to add to the current frame. To open the shutter before the current frame, enter a negative value. For example, a value of - 0.5 would open the shutter half a frame before the current frame.</li> </ul> |

| Control (UI) | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                |
|--------------|---------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | shuttercustomoffset | 0             | If the <b>shutter offset</b> control is set to <b>custom</b> , this field is used to set the time that the shutter opens by adding it to the current frame. Values are in frames, so -0.5 would open the shutter half a frame before the current frame. |

# Card3D

The Card3D node lets you apply the same geometric transformations possible with the Transform node, but gives you an additional axis of operation, z. It transforms the image as though it was printed on a flat card and placed in front of the camera. The Card3D node's transformations are not truly 3D, but rather what is sometimes called "2.5D" - meaning that you can move an element back on the z axis, but doing so does not convey the sense that it is behind or in front of another element. 2.5D transformations are useful for tasks like "cheating" the perspective of an element or "faking" a camera zoom.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                  |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | axis            | An optional Axis node that works as null object to which the card can be parented. If connected, you can use the Axis transformation controls to control the Card3D node. Rotating the Axis node, for example, rotates the Card3D node. This can be useful if you want to control several nodes using the same Axis node. |
|                 | cam             | An optional Camera node used for viewing the card.                                                                                                                                                                                                                                                                        |
|                 | unnamed         | The image to place on the card.                                                                                                                                                                                                                                                                                           |

| Control (UI)                                                                      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| rotate xyz     | rotate           | 0, 0, 0       | Rotates the card on the x, y, and z axes. This is useful for cheating the perspective.<br><br>Alternatively, you can press <b>Ctrl/Cmd</b> while dragging on any axis on the transformation overlay in the Viewer.                                                                                                                                                                                                                                                                                       |
| scale xyz      | scaling          | 1, 1, 1       | Scales the card on the x, y, and z axes.<br><br>Setting one of these to a negative value reverses the input image along that axis.                                                                                                                                                                                                                                                                                                                                                                       |
| uniform scale  | uniform_scale    | 1             | Scales the frame simultaneously on x, y, and z. This effectively gangs the <b>scale xyz</b> values.                                                                                                                                                                                                                                                                                                                                                                                                      |
| skew xyz       | skew             | 0, 0, 0       | Skews the card on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| pivot xyz      | pivot            | 0, 0, 0       | When you make changes to the card's position, scaling and rotation, these occur from the location of the card's origin point or pivot. The <b>pivot x, y</b> , and <b>z</b> controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the card. Subsequent local transformations will then occur relative to the new pivot point location.<br><br>You can also position the pivot point by pressing <b>Ctrl/Cmd+Alt</b> while dragging in the Viewer. |
| Local matrix   |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Control (UI)      | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                                           |
|-------------------|-------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| specify matrix    | useMatrix         | disabled      | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                        |
| matrix            | matrix            | N/A           | <p>The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p>                                              |
| geometry          |                   |               |                                                                                                                                                                                                                                                                                                                                    |
| lens-in focal     | lens_in_focal     | 1             | The focal length of the camera that took the picture on the card. The card is scaled to the correct size so that at distance <b>Z</b> , the card fills this field of view.                                                                                                                                                         |
| lens-in haperture | lens_in_haperture | 1             | The horizontal aperture of the camera that took the picture on the card. The card is scaled to the correct size so that at distance <b>Z</b> , the card fills this field of view.                                                                                                                                                  |
| render params     |                   |               |                                                                                                                                                                                                                                                                                                                                    |
| output format     | format            | root.format   | Select the format to which you want to output the sequence. If the format does not yet exist, you can select <b>new</b> to create a new format from scratch. The default setting, <b>root.format</b> , resizes the image to the format indicated on the <b>Project Settings</b> dialog box.                                        |
| filter            | filter            | Cubic         | Select the filtering algorithm to use when remapping pixels from their original positions to new positions. This allows you to avoid problems with image quality, particularly in high contrast areas of the frame (where highly aliased, or jaggy, edges may appear if pixels are not filtered and retain their original values). |

| motionblur     | motionblur       | 0             | <p>Sets the number of motion blur samples. A value of 1 should produce reasonable results for most sequences.</p> <p>Increase the value to produce more samples for higher quality, or decrease it to shorten the processing time. The higher the value, the smoother the result.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| shutter        | shutter          | 0.5           | <p>Enter the number of frames the shutter stays open when motion blurring. For example, a value of 0.5 corresponds to half a frame. Increasing the value produces more blur, and decreasing the value less.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| shutter offset | shutteroffset    | start         | <p>This value controls how the shutter behaves with respect to the current frame value. It has four options:</p> <ul style="list-style-type: none"> <li>• <b>centred</b> - center the shutter around the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29,5 to 30,5.</li> <li>• <b>start</b> - open the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 30 to 31.</li> <li>• <b>end</b> - close the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29 to 30.</li> <li>• <b>custom</b> - open the shutter at the time you specify.</li> </ul> |

| Control (UI) | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                  |
|--------------|---------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                     |               | In the field next to the dropdown menu, enter a value (in frames) you want to add to the current frame. To open the shutter before the current frame, enter a negative value. For example, a value of - 0.5 would open the shutter half a frame before the current frame. |
|              | shuttercustomoffset | 0             | If the <b>shutter offset</b> control is set to <b>custom</b> , this field is used to set the time that the shutter opens by adding it to the current frame. Values are in frames, so -0.5 would open the shutter half a frame before the current frame.                   |

# CornerPin2D

The CornerPin2D node is designed to map the four corners of an image sequence to or from positions derived from tracking data. In practice, this node lets you replace any four-cornered feature with another image sequence. You can use it to place an image in an on-screen television, for example.

Before using this node, you should use the Tracker node to generate four tracks, one per corner, on the feature requiring replacement.

**Note:** In order to populate the **to** and **from** fields with the right values, you need to create the CornerPin2D node with your input image selected in the Node Graph. If the CornerPin node is created as an unconnected node, the **to** and **from** fields use the root format values.

# Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                            |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | <p>The image that will replace the feature tracked using the Tracker node.</p> <p>Note that the CornerPin2D node should NOT be connected to the Tracker node or the Tracker node's input image.</p> |

|                |                     |               | <p>sequences.</p> <p>Increase the value to produce more samples for higher quality, or decrease it to shorten the processing time. The higher the value, the smoother the result.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| shutter        | shutter             | 0.5           | Enter the number of frames the shutter stays open when motion blurring. For example, a value of 0.5 corresponds to half a frame. Increasing the value produces more blur, and decreasing the value less.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| shutter offset | shutteroffset       | start         | <p>This value controls how the shutter behaves with respect to the current frame value. It has four options:</p> <ul style="list-style-type: none"> <li>• <b>centred</b> - center the shutter around the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29,5 to 30,5.</li> <li>• <b>start</b> - open the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 30 to 31.</li> <li>• <b>end</b> - close the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29 to 30.</li> <li>• <b>custom</b> - open the shutter at the time you specify. In the field next to the dropdown menu, enter a value (in frames) you want to add to the current frame. To open the shutter before the current frame, enter a negative value. For example, a value of - 0.5 would open the shutter half a frame before the current frame.</li> </ul> |
|                | shuttercustomoffset | 0             | If the <b>shutter offset</b> control is set to <b>custom</b> , this field is used to set the time that the shutter opens                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                       |
|--------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | by adding it to the current frame. Values are in frames, so -0.5 would open the shutter half a frame before the current frame.                                                                                                                                                                                                 |
| From Tab     |                  |               |                                                                                                                                                                                                                                                                                                                                |
| from1 xy     | from1            | N/A           | This value is identical to the original <b>to1</b> value (bottom left), and you can change this value manually to adjust the corner pin result. You can, for example, make your result bigger than the original tracked polygon area by giving your corners new xy values, or reposition the corners to get a mirrored image.  |
| from2 xy     | from2            | N/A           | This value is identical to the original <b>to2</b> value (bottom right), and you can change this value manually to adjust the corner pin result. You can, for example, make your result bigger than the original tracked polygon area by giving your corners new xy values, or reposition the corners to get a mirrored image. |
| from3 xy     | from3            | N/A           | This value is identical to the original <b>to3</b> value (top right), and you can change this value manually to adjust the corner pin result. You can, for example, make your result bigger than the original tracked polygon area by giving your corners new xy values, or reposition the corners to get a mirrored image.    |
| from4 xy     | from4            | N/A           | This value is identical to the original <b>to4</b> value (top left), and you can change this value manually to adjust the corner pin result. You can, for example, make your result bigger than the original tracked polygon area by giving your corners new xy values, or reposition the corners to get a mirrored image.     |
| Set to input | set_to_input     | N/A           | Click to set the <b>from</b> values to the input format.                                                                                                                                                                                                                                                                       |
| Copy 'to'    | copy_from_to     | N/A           | Click to copy and paste the <b>to1-4</b> values to the <b>from1-4</b> values.                                                                                                                                                                                                                                                  |

# Crop

The Crop node lets you cut out the unwanted portions of the image area. You can fill the cropped portion with black or adjust the image output format to match the cropped image.

## Inputs and Controls

| Connection Type | Connection Name | Function                    |
|-----------------|-----------------|-----------------------------|
| Input           | unnamed         | The image sequence to crop. |

| Control (UI)                      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|              |                  |               | <p>or if you want to texture-map or intersect the output with a similar shape.</p> <div>  <b>Note:</b> Enabling <b>black outside</b> also adds a solid alpha covering the input image area if no alpha is present. </div> |

# GridWarp

The GridWarp node allows you to warp images by transferring image information from one Bezier grid onto another. When using this node, you first position the source grid, which defines where to warp from. Next, you position the destination grid, which defines where to warp the image to. This grid can be a duplicate of the source grid, or you can define it separately. When you manipulate the destination grid, the corresponding warp is applied to the source image.

See also [SplineWarp](#).

| source color      | source_color      | N/A           | Sets the color of the source grid.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| destination color | destination_color | N/A           | Sets the color of the destination grid.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

# GridWarpTracker

GridWarpTracker is an alternate solution to manual tracking with PlanarTracker, which allows you to warp and morph using custom grid shapes driven by tracking data, rather than being constrained to rigid transformations. If you have a NukeX or Nuke Studio license, you can also use SmartVectors to drive the grids.

The **From** and **To** grids allow you to add and copy tracking data between grids so that you can make adjustments without losing your original data and without having to create a backup version of the node. If you have a NukeX or Nuke Studio license, you can add keyframed adjustment grids to modify your **From** and **To** grid shapes without altering the original grid data.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                          |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------|
| Input           | src             | The sequence you want to warp or morph.                                                                           |
|                 | dst             | An optional input to which the <b>src</b> image is morphed using the <b>Morph Amount</b> and <b>Mix</b> controls. |
|                 | SmartVector     | An optional input allowing you to drive the warp or morph using NukeX's SmartVector node.                         |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                             |
|---------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GridWarpTracker Tab |                  |               |                                                                                                                                                                                                      |
| channels            | channels         | all           | The warp effect is only applied to these channels.<br><br>If you set this to something other than <b>all</b> or <b>none</b> , you can use the checkboxes on the right to select individual channels. |
| mask                | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                        |
|                     | maskChannelInput | none          | The channel to use as a mask. By default, the filter effect is limited to the non-black areas of this channel.                                                                                       |
| inject              | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                         |
| invert              | invert_mask      | disabled      | Inverts the use of the mask channel so that the filter                                                                                                                                               |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                          |
|--------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | effect is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                             |
| fringe       | fringe           | disabled      | <p>When enabled, only apply the effect to the edge of the mask.</p> <p>When disabled, the effect is applied to the entire mask.</p>                                                                                                                                                                                                               |
| Mode         |                  |               |                                                                                                                                                                                                                                                                                                                                                   |
| Output       | output           | Warp          | <p>Sets the output displayed in the Viewer:</p> <ul style="list-style-type: none"> <li>• <b>Warp</b> - displays the warped <b>src</b> input from the points in the <b>From</b> grid to the points in the <b>To</b> grid.</li> <li>• <b>Morph</b> - displays both grids and the morphed image depending on the warp and mix parameters.</li> </ul> |
| Invert       | invert_warp      | disabled      | When enabled, swap the From and To grids so that the warped destination is displayed, rather than the warped source.                                                                                                                                                                                                                              |
| Warp Amount  | warp             | 1             | When <b>Output</b> is set to <b>Warp</b> , controls the amount of warp between the <b>From</b> and <b>To</b> grids, where <b>1</b> is the full warp and <b>0</b> is the source image.                                                                                                                                                             |
| Morph Amount | morph            | 1             | When <b>Output</b> is set to <b>Morph</b> , controls the strength of morphing between the <b>From</b> and <b>To</b> grids, where <b>1</b> is the full morph and <b>0</b> is the source image.                                                                                                                                                     |
| Mix          | mix              | 0             | When <b>Output</b> is set to <b>Morph</b> , adjusts the mix between the source and destination images, where 0 is the source image and 1 is the destination image.                                                                                                                                                                                |
| Set BBox To  | bbox             | Union         | Select how you want to output the bounding box. The default is <b>Union</b> , which combines the two bounding boxes. You can also select <b>Format</b> to set the bounding box to the format size.                                                                                                                                                |

| Control (UI)                                                                        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                |

| Submesh Resolution | render_res       | 10            | Sets the number of subdivisions that are created between bezier curves in the grid.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Filter             | filter           | Cubic         | <p>Sets the image resampling filter to use when remapping pixels from their original positions to new positions. This allows you to avoid problems with image quality, particularly in high contrast areas of the frame (where highly aliased, or jaggy, edges may appear if pixels are not filtered and retain their original values).</p> <ul style="list-style-type: none"> <li>• <b>Impulse</b> - remapped pixels carry their original values.</li> <li>• <b>Cubic</b> - remapped pixels receive some smoothing.</li> <li>• <b>Keys</b> - remapped pixels receive some smoothing, plus minor sharpening (as shown by the negative -y portions of the curve).</li> <li>• <b>Simon</b> - remapped pixels receive some smoothing, plus medium sharpening (as shown by the negative -y portions of the curve).</li> <li>• <b>Rifman</b> - remapped pixels receive some smoothing, plus significant sharpening (as shown by the negative -y portions of the curve).</li> <li>• <b>Mitchell</b> - remapped pixels receive some smoothing, plus blurring to hide pixelation.</li> <li>• <b>Parzen</b> - remapped pixels receive the greatest smoothing of all filters.</li> <li>• <b>Notch</b> - remapped pixels receive flat smoothing (which tends to hide moire patterns).</li> <li>• <b>Lanczos4</b>, <b>Lanczos6</b>, and <b>Sinc4</b> - remapped pixels receive sharpening which can be useful for scaling down. <b>Lanczos4</b> provides the least sharpening and <b>Sinc4</b> the most.</li> </ul> |

Python Tab (These controls are for Python callbacks and can be used to have Python functions automatically called when various events happen in Nuke.)

| Control (UI)      | Knob (Scripting)  | Default Value | Function                                                                                                                                             |
|-------------------|-------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| before render     | beforeRender      | none          | These functions run prior to starting rendering in <b>execute()</b> . If they throw an exception, the render aborts.                                 |
| before each frame | beforeFrameRender | none          | These functions run prior to starting rendering of each individual frame. If they throw an exception, the render aborts.                             |
| after each frame  | afterFrameRender  | none          | These functions run after each frame is finished rendering. They are not called if the render aborts. If they throw an exception, the render aborts. |
| after render      | afterRender       | none          | These functions run after rendering of all frames is finished. If they throw an error, the render aborts.                                            |
| render progress   | renderProgress    | none          | These functions run during rendering to determine progress or failure.                                                                               |

# IDistort

IDistort warps the input image based on the values in the image's **UV channels**. The U and V values are offsets for where a pixel will come from. For example, if pixel 51, 23 has a U and V value of -1, 5, the pixel's value will come from 50, 28 of the input channels.

You can use the Copy node to merge the two distortion channels in with your image channels, and then select the two channels from the **UV channels** dropdown menu.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                          |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | This input needs to include both the channels to distort and the two channels to use to calculate the distortion. |

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | mask            | <p>An optional image to use as a mask. By default, the distortion is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                          |

# LensDistortion

The LensDistortion node (NukeX and Nuke Studio only) estimates the lens distortion in a given image, either through Grid Detection or manual Line Detection. The warp can then be used to add or remove distortion or produce an STMap in the **motion** channel for use elsewhere.

**Note:** You must perform the analysis in NukeX or Nuke Studio, but you can use the results in Nuke.

## Inputs and Controls

| Connection Type | Connection Name | Function                    |

The coordinate systems are relative to the distortion centre.</p> |

The denominator and numerator controls are dependent on the distortion **Model Preset** applied on the **LenDistortion** tab.

| after each frame | afterFrameRender | none          | These functions run after each frame is finished rendering. They are not called if the render aborts. If they throw an exception, the render aborts. |
| after render     | afterRender      | none          | These functions run after rendering of all frames is finished. If they throw an error, the render aborts.                                            |
| render progress  | renderProgress   | none          | These functions run during rendering to determine progress or failure.                                                                               |

# Mirror

This node flips the input image around the center of the format area. A flip on the x axis mirrors the image vertically. A flop on the on the y axis mirrors the image horizontally.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                    |
|-----------------|-----------------|-------------------------------------------------------------|
| Input           | unnamed         | The image sequence to flip vertically or flop horizontally. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                      |
|--------------|------------------|---------------|---------------------------------------------------------------|
| Mirror Tab   |                  |               |                                                               |
| Horizontal   | Horizontal       | disabled      | When enabled, Nuke flops the image 180 on the y axis.         |
| Vertical     | Vertical         | disabled      | When enabled, Nuke flips the image 180 degrees on the x axis. |

# PointsTo3D

Use the PointsTo3D node to calculate the 3D location of a 2D point in an image sequence using the parallax between two or three tracked points.

Attach an image and its corresponding tracked camera to the PointsTo3D node inputs. Select the 2D point you want to calculate, place **A** on that point at a particular frame and click **set frame**. Now, change the frame to a different camera angle and specify that same 2D feature with **B** and click **set frame**. Repeat for point **C**, again on a different frame. Click **calculate** to generate the point in 3D space as well as that point converted back to screen space.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                          |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | cam             | A Camera node whose movement matches that of the camera used to shoot the input sequence. This can be a camera you have created using the CameraTracker node or a camera you have imported from a third-party 3D application, for example. Note that the camera must be animated. |
|                 | img             | The image sequence that has a 2D point whose 3D position you want to calculate.                                                                                                                                                                                                   |

| after render                                                                                                                                           | afterRender       | none          | These functions run after rendering of all frames is finished. If they throw an error, the render aborts.                                                                                                                                                                             |
| render progress                                                                                                                                        | renderProgress    | none          | These functions run during rendering to determine progress or failure.                                                                                                                                                                                                                |

# Position

Position moves the input image by an integer number of pixels. It fills the area between the original image and the moved image by repeating the edge pixels.

## Inputs and Controls

| Connection Type | Connection Name | Function                    |
|-----------------|-----------------|-----------------------------|
| Input           | unnamed         | The image sequence to move. |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                              |
|----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Position Tab   |                  |               |                                                                                                                                                       |
| translate x, y | translate        | 0, 0          | How much to move the image on the x and y axes. Positive values move the image up or to the right, while negative values move it down or to the left. |

# Reconcile3D

Reconcile3D turns a point in 3D space into an x, y position in the camera. The 3D point is controlled by the first fields in the properties panel, and by the optional **Axis** input. The point is projected through the camera to the image and the position of the result is put in **XY output**. In addition, the absolute 3D point is put in **XYZ output** (this is only useful if there is an Axis parent, otherwise it is the same as the input point). This lets you lock a photographed plate to a 3D scene or track.

**Note:** The point must be in front of the camera to evaluate correctly.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                  |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------|
| Input           | axis            | <b>3D point</b> control coordinates are relative to this optional input.                                  |
|                 | cam             | The viewing camera. This might be created using CameraTracker or imported from a 3rd party application.   |
|                 | img             | The image in which you want to position the 3D point.<br>Output resolution is determined from this image. |

| Control (UI)          | Knob (Scripting) | Default Value | Function                                                                                                                                                   |

|                |                  |               |  <b>Note:</b> Enabling <b>black outside</b> also adds a solid alpha covering the input image area if no alpha is present.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| motionblur     | motionblur       | 0             | <p>Sets the number of motion blur samples. A value of 1 should produce reasonable results for most sequences.</p> <p>Increase the value to produce more samples for higher quality, or decrease it to shorten the processing time. The higher the value, the smoother the result.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| shutter        | shutter          | 0.5           | <p>Enter the number of frames the shutter stays open when motion blurring. For example, a value of 0.5 corresponds to half a frame. Increasing the value produces more blur, and decreasing the value less.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| shutter offset | shutteroffset    | start         | <p>This value controls how the shutter behaves with respect to the current frame value. It has four options:</p> <ul style="list-style-type: none"> <li>• <b>centred</b> - center the shutter around the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29,5 to 30,5.</li> <li>• <b>start</b> - open the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 30 to 31.</li> <li>• <b>end</b> - close the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29 to 30.</li> <li>• <b>custom</b> - open the shutter at the time you specify.</li> </ul> |

| Control (UI) | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                  |
|--------------|---------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                     |               | In the field next to the dropdown menu, enter a value (in frames) you want to add to the current frame. To open the shutter before the current frame, enter a negative value. For example, a value of - 0.5 would open the shutter half a frame before the current frame. |
|              | shuttercustomoffset | 0             | If the <b>shutter offset</b> control is set to <b>custom</b> , this field is used to set the time that the shutter opens by adding it to the current frame. Values are in frames, so -0.5 would open the shutter half a frame before the current frame.                   |

Python Tab (These controls are for Python callbacks and can be used to have Python functions automatically called when various events happen in Nuke.)

|                   |                   |      |                                                                                                                                                      |
|-------------------|-------------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| before render     | beforeRender      | none | These functions run prior to starting rendering in execute(). If they throw an exception, the render aborts.                                         |
| before each frame | beforeFrameRender | none | These functions run prior to starting rendering of each individual frame. If they throw an exception, the render aborts.                             |
| after each frame  | afterFrameRender  | none | These functions run after each frame is finished rendering. They are not called if the render aborts. If they throw an exception, the render aborts. |
| after render      | afterRender       | none | These functions run after rendering of all frames is finished. If they throw an error, the render aborts.                                            |
| render progress   | renderProgress    | none | These functions run during rendering to determine progress or failure.                                                                               |

# Reformat

Reformat lets you resize and reposition your image sequences to a different format (width and height). This also allows you to use plates of varying image resolution on a single script without running into issues when combining them. All scripts should include Reformat nodes after each Read node to specify, at the very least, the output resolution of the images in the script.

## Inputs and Controls

| Connection Type | Connection Name | Function             |
|-----------------|-----------------|----------------------|
| Input           | unnamed         | The image to resize. |

# SphericalTransform

SphericalTransform converts images between different projections, including 360 rigs using the CaraVR toolset in NukeX. These view projections can be divided into two broad categories:

- full frame, such as **Latlong**, encompassing the entire 360 world around a single point, and
- partial frame, such as the **Rectilinear** view, that Nuke was designed to work in.

The **Output** rotation is also controllable using an in-viewer control system. Hold down **Ctrl/Cmd+Alt** and left-click and drag to move the image around, setting the pan and tilt setting. Add **Shift** to lock into a single dimension for the movement. In a partial frame projection, use the right mouse button to set the **focal length**, in essence zooming in and out.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                             |
|-----------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Input           | -Z              | An environment map you want to convert to another type. Input names vary according to the <b>Project</b> and <b>Format</b> selected. |

| Control (UI)           | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

# SplineWarp

The SplineWarp node warps an image based on multiple shapes or pins that you create. Unlike the GridWarp node, you can draw these shapes anywhere on either image, rather than only add points on the existing grid lines, and corresponding shapes can have differing numbers of points. You can also copy and paste shapes from other SplineWarp and [Roto](#) or [RotoPaint](#) nodes.

See also [GridWarp](#).

| Input           | A               | The image to warp from, though B to A warps are equally valid.                                                                                                                                                                                                                                                                               |
|                 | B               | The image to warp to, though B to A warps are equally valid.                                                                                                                                                                                                                                                                                 |
|                 | mask            | <p>An optional image to use as a mask. By default, the warp effect is limited to the non-black areas of the mask. All channels for pixels outside the mask region are copied from input A.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask.</p> |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SplineWarp Tab    |                  |               |                                                                                                                                                                                                                                                                                                                                                                                             |
| channels          | channels         | all           | <p>The warp effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> <div>  <b>Note:</b> There is no need to include the output mask channel in this layer. </div> |
| premultiply input | premultiply      | disabled      | <p>When enabled, premultiply the input channels by a mask from the combined <b>cookie cutter</b> shapes prior to warping. This control uses the same mask as <b>output mask</b> but may be used without assigning an <b>output mask</b> channel.</p>                                                                                                                                        |

| Control (UI)        | Knob (Scripting) | Default Value    | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|------------------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     |                  |                  |  <b>Note:</b> This control can only be enabled when the <b>curves</b> list contains shapes designated as <b>cookiecutters</b> .                                                                                                                                                                                                                                                           |
| output mask         | outputMask       | mask_splinwarp.a | Sets the channel to be replaced by a mask from the combined cookie cutter shapes.<br><br> <b>Note:</b> This control can only be enabled when the <b>curves</b> list contains shapes designated as <b>cookiecutters</b> .                                                                                                                                                                  |
| crop to format      | crop_to_format   | enabled          | When disabled, the input image is not cropped to the <b>Project Settings &gt; full format size</b> . As a result, warping can introduce pixels from the image outside the format size, rather than black.<br><br> <b>Note:</b> Disabling <b>crop to format</b> can affect performance as Nuke has to calculate the warp for the entire image, not just the area inside the format size. |
| bbox boundary curve | boundary_bbox    | enabled          | When enabled, a curve is added at the format boundaries, effectively pinning the corners of the image.<br><br>This boundary can be tightened by increasing <b>boundary curve resolution</b> on the <b>Render</b> tab.                                                                                                                                                                                                                                                      |
| output              | output           | source warped    | Controls what output is displayed in the Viewer: <ul style="list-style-type: none"> <li>• <b>A</b> - the A input image.</li> <li>• <b>A warped</b> - the warped A input image.</li> <li>• <b>B</b> - the B input image.</li> <li>• <b>B warped</b> - the warped B input image.</li> <li>• <b>AB morph</b> - the morphed image, controlled by the <b>warp</b> and <b>mix</b> controls.</li> </ul>                                                                           |

# Stabilize

The Stabilize2D node is designed to remove unwanted camera movement, rotation, and/or scaling from an image sequence. The node requires data from only a single track if you only need to stabilize movement; it requires data from two tracks if you need to stabilize for rotation and/or scaling.

The basic procedure for using Stabilize2D is to first use the [Tracker](#) node to generate the required tracks, then follow the Tracker node with a Stabilize2D node. To this node, you apply the tracking data in inverse form, thus negating the unwanted transformations.

# STMap

The STMap node allows you to move pixels around in an image. STMap uses two channels to figure out where each pixel in the resulting image should come from in the input channels. You can use the Copy node to merge the two distortion channels in with your image channels and then select the two channels in the **U** and **V** selection boxes. The U and V values are the absolute position of the source pixel. The values are

normalized to be between 0 and 1, where 0 is the bottom left corner of the input image, and 1 is the top right corner.

You can also calculate the lens distortion on one image and apply that distortion to another image using the STMap node. See [LensDistortion](#) for more details.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | stmap           | The input you want to use to alter the source image.                                                                                                                                                                                                                                                                                                                        |
|                 | src             | The source image to which you want to apply the effect.                                                                                                                                                                                                                                                                                                                     |
|                 | mask            | <p>An optional image to use as a mask. By default, the distortion is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                        |

# Tile

Tile produces an output image that contains scaled-down, tiled copies of the input image. The output image is the same format as the input.

## Inputs and Controls

| Connection Type | Connection Name | Function                                   |
|-----------------|-----------------|--------------------------------------------|
| Input           | unnamed         | The image to reproduce by rows or columns. |

| Control (UI) | Knob (Scripting) | Default Value | Function |
|--------------|------------------|---------------|----------|
| Tile Tab     |                  |               |          |

|              |                  |               | receive sharpening which can be useful for scaling down. <b>Lanczos4</b> provides the least sharpening and <b>Sinc4</b> the most. |

# Tracker

This is a 2D tracker that allows you to extract animation data from the position, rotation, and size of an image. Using expressions, you can apply the data directly to transform and match-move another element. Or you can invert the values of the data and apply them to the original element - again through expressions - to stabilize the image.

This is the general process for tracking an image:

1. Connect a Tracker node to the image you want to track.
2. Use auto-tracking for simple tracks or place tracking anchors on features at keyframes in the image.
3. Calculate the tracking data.
4. Choose the tracking operation you want to perform: **stabilize**, **match-move**, etc.

See the [Tracker](#) section for details on tracking methods and troubleshooting tips.

## Inputs and Controls

| Connection Type | Connection Name | Function                        |
|-----------------|-----------------|---------------------------------|
| Input           | unnamed         | The sequence you want to track. |

| Control (UI) | Knob (Scripting) | Default Value             | Function                                                                                                                                                                                                                 |

|                |                     |               | <p>of 1 should produce reasonable results for most sequences.</p> <p>Increase the value to produce more samples for higher quality, or decrease it to shorten the processing time. The higher the value, the smoother the result.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| shutter        | shutter             | 0.5           | Enter the number of frames the shutter stays open when motion blurring. For example, a value of 0.5 corresponds to half a frame. Increasing the value produces more blur, and decreasing the value less.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| shutter offset | shutteroffset       | start         | <p>Controls how the shutter behaves with respect to the current frame value:</p> <ul style="list-style-type: none"> <li>• <b>centred</b> - center the shutter around the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29,5 to 30,5.</li> <li>• <b>start</b> - open the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 30 to 31.</li> <li>• <b>end</b> - close the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29 to 30.</li> <li>• <b>custom</b> - open the shutter at the time you specify. In the field next to the dropdown menu, enter a value (in frames) you want to add to the current frame. To open the shutter before the current frame, enter a negative value. For example, a value of - 0.5 would open the shutter half a frame before the current frame.</li> </ul> |
|                | shuttercustomoffset | 0             | If the <b>shutter offset</b> control is set to <b>custom</b> , this                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                            |
|--------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | field is used to set the time that the shutter opens by adding it to the current frame. Values are in frames, so -0.5 would open the shutter half a frame before the current frame. |

# Transform

Transform lets you not only translate elements, but also rotate, scale, and skew them from a single control panel.

You can also create this node by pressing **T** on the Node Graph.

See also [TransformMasked](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                        |
|-----------------|-----------------|-------------------------------------------------|
| Input           | unnamed         | The image to translate, rotate, scale, or skew. |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                      |
|----------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Transform Tab  |                  |               |                                                                                                                                               |
| translate x, y | translate        | 0, 0          | Translates the image along the x and y axes. You can also adjust translate values by dragging the transform handle in the Viewer.             |
| rotate         | rotate           | 0             | Rotates the image around the <b>center x y</b> coordinates. You can also adjust rotate values by dragging the transform handle in the Viewer. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| scale        | scale            | 1             | Scales the image width and height around the <b>center x y</b> coordinates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| skew X       | skewX            | 0             | Skews the image on the x axis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| skew Y       | skewY            | 0             | Skews the image on the y axis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| skew order   | skew_order       | XY            | Sets the order in which skew transforms are applied to the image: <ul style="list-style-type: none"> <li>• XY</li> <li>• YX</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| center x, y  | center           | N/A           | Sets the center of rotation and scale on the x and y axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| invert       | invert_matrix    | disabled      | When enabled, any transform you applied using the <b>translate xy</b> , <b>rotate</b> , <b>scale</b> , <b>skew</b> , or <b>center xy</b> controls is inverted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| filter       | filter           | Cubic         | Select the filtering algorithm to use when remapping pixels from their original positions to new positions. This allows you to avoid problems with image quality, particularly in high contrast areas of the frame (where highly aliased, or jaggy, edges may appear if pixels are not filtered and retain their original values). <ul style="list-style-type: none"> <li>• <b>Impulse</b> - remapped pixels carry their original values.</li> <li>• <b>Cubic</b> - remapped pixels receive some smoothing.</li> <li>• <b>Keys</b> - remapped pixels receive some smoothing, plus minor sharpening (as shown by the negative -y portions of the curve).</li> <li>• <b>Simon</b> - remapped pixels receive some smoothing, plus medium sharpening (as shown by the negative -y portions of the curve).</li> <li>• <b>Rifman</b> - remapped pixels receive some smoothing, plus significant sharpening (as shown by the negative -y portions of the curve).</li> </ul> |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                  |               | <ul style="list-style-type: none"> <li>• <b>Mitchell</b> - remapped pixels receive some smoothing, plus blurring to hide pixelation.</li> <li>• <b>Parzen</b> - remapped pixels receive the greatest smoothing of all filters.</li> <li>• <b>Notch</b> - remapped pixels receive flat smoothing (which tends to hide moire patterns).</li> <li>• <b>Lanczos4</b>, <b>Lanczos6</b>, and <b>Sinc4</b> - remapped pixels receive sharpening which can be useful for scaling down. <b>Lanczos4</b> provides the least sharpening and <b>Sinc4</b> the most.</li> </ul>                                                                                              |
| clamp         | clamp            | disabled      | When using filters that employ sharpening, such as <b>Rifman</b> and <b>Lanczos</b> , you may see a haloing effect. If necessary, check <b>clamp</b> to correct this problem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| black outside | black_outside    | enabled       | <p>This renders as black pixels outside the image boundary, making it easier to layer the element over another. If you uncheck this control, the outside area is filled with the outermost pixels of the image sequence.</p> <p>In most cases, you should keep <b>black outside</b> checked. However, you may want to turn this off for camera shake, or if you want to texture-map or intersect the output with a similar shape.</p> <div>  <b>Note:</b> Enabling <b>black outside</b> also adds a solid alpha covering the input image area if no alpha is present. </div> |
| motionblur    | motionblur       | 0             | Sets the number of motion blur samples. A value of 1 should produce reasonable results for most                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Control (UI)   | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                |                     |               | <p>sequences.</p> <p>Increase the value to produce more samples for higher quality, or decrease it to shorten the processing time. The higher the value, the smoother the result.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| shutter        | shutter             | 0.5           | Enter the number of frames the shutter stays open when motion blurring. For example, a value of 0.5 corresponds to half a frame. Increasing the value produces more blur, and decreasing the value less.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| shutter offset | shutteroffset       | start         | <p>Controls how the shutter behaves with respect to the current frame value:</p> <ul style="list-style-type: none"> <li>• <b>centred</b> - center the shutter around the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29,5 to 30,5.</li> <li>• <b>start</b> - open the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 30 to 31.</li> <li>• <b>end</b> - close the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29 to 30.</li> <li>• <b>custom</b> - open the shutter at the time you specify. In the field next to the dropdown menu, enter a value (in frames) you want to add to the current frame. To open the shutter before the current frame, enter a negative value. For example, a value of - 0.5 would open the shutter half a frame before the current frame.</li> </ul> |
|                | shuttercustomoffset | 0             | If the <b>shutter offset</b> control is set to <b>custom</b> , this field is used to set the time that the shutter opens by adding it to the current frame. Values are in frames, so -0.5 would open the shutter half a frame before the current frame.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

# TransformMasked

This node lets you translate, rotate, scale, or skew an image in 2D in the same way as the [Transform](#) node, but it also offers controls for assigning a mask to protect certain areas of the frame from transforms.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The input you want to translate, rotate, scale, or skew.                                                                                                                                                                                                                                                                                                                   |
|                 | mask            | <p>An optional image to use as a mask. By default, the transform is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                 |
|---------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transform Tab |                  |               |                                                                                                                                                                                                          |
| channels      | channels         | all           | <p>The transform is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> |
| translate xy  | translate        | 0, 0          | Translates the input on the x and y axes.                                                                                                                                                                |
| rotate        | rotate           | 0             | Rotates the input by degrees. Negative values produce anti-clockwise rotation.                                                                                                                           |
| scale         | scale            | 1             | Scales the input. Scale width and height are ganged by default.                                                                                                                                          |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| clamp         | clamp            | disabled      | When using filters that employ sharpening, such as <b>Rifman</b> and <b>Lanczos</b> , you may see a haloing effect. If necessary, check <b>clamp</b> to correct this problem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| black outside | black_outside    | enabled       | <p>This renders as black pixels outside the image boundary, making it easier to layer the element over another. If you uncheck this control, the outside area is filled with the outermost pixels of the image sequence.</p> <p>In most cases, you should keep <b>black outside</b> checked. However, you may want to turn this off for camera shake, or if you want to texture-map or intersect the output with a similar shape.</p> <div>  <b>Note:</b> Enabling <b>black outside</b> also adds a solid alpha covering the input image area if no alpha is present. </div> |
| motionblur    | motionblur       | 0             | Sets the number of motion blur samples. A <b>motionblur</b> value of 1 should produce reasonable                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Control (UI)   | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|---------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                     |               | <p>results for most sequences.</p> <p>Increase the <b>motionblur</b> value to produce more samples for higher quality, decrease it to shorten the processing time.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| shutter        | shutter             | 0.5           | How long the shutter remains open (measured in frames) to produce motion blurring. The default value sets the shutter open for half a frame.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| shutter offset | shutteroffset       | start         | <p>This value controls how the shutter behaves with respect to the current frame value. It has four options:</p> <ul style="list-style-type: none"> <li>• <b>centred</b> - center the shutter around the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29,5 to 30,5.</li> <li>• <b>start</b> - open the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 30 to 31.</li> <li>• <b>end</b> - close the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29 to 30.</li> <li>• <b>custom</b> - open the shutter at the time you specify. In the field next to the dropdown menu, enter a value (in frames) you want to add to the current frame. To open the shutter before the current frame, enter a negative value. For example, a value of - 0.5 would open the shutter half a frame before the current frame.</li> </ul> |
|                | shuttercustomoffset | 0             | If the <b>shutter offset</b> control is set to <b>custom</b> , this field is used to set the time that the shutter opens by adding it to the current frame. Values are in frames, so -0.5 would open the shutter half a frame                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                     |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | before the current frame.                                                                                                                    |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                |
|              | maskChannelInput | none          | The channel to use as a matte. By default, the transform is limited to the non-black areas of this channel.                                  |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream. |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel, so that the transform is limited to the non-white areas of the mask.                                    |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.                                                                                 |
|              |                  |               | When disabled, the effect is applied to the entire mask.                                                                                     |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                                          |

# TVIScale

This node scales an image by a factor of two. It uses a Total Variational Inpainting (TVI) technique that minimizes noise while still preserving the edges. The **Lambda** control is the main control here. The larger the value, the less smoothing is allowed and the more noise present in the original image makes it to the larger image.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The input you want to scale by a factor of two.                                                                                                                                                                                                                                                                                                                            |
|                 | mask            | <p>An optional image to use as a mask. By default, the transform is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                  |
|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TVIScale Tab |                  |               |                                                                                                                                                                                                                                                           |
| channels     | channels         | all           | <p>The scale is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p>                                                      |
| Iterations   | Iterations       | 5             | <p>Sets the number of iterations to apply to achieve the best solution.</p> <p>This is an iterative filter - the longer it runs, the closer it gets to the 'best' solution. In this case, the noisy smooth areas converge on a non-noisy smooth area.</p> |
| Lambda       | Lambda           | 5             | <p>Controls how far the filtered values are allowed to stray from the original input.</p> <p>The larger the value, the less smoothing is allowed and the more noise present in the original image makes it to the larger image.</p>                       |
| A            | A                | 0.0001        | This is a regularization control that should always be                                                                                                                                                                                                    |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                     |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | above zero to prevent Divides-By-Zero in the algorithm.                                                                                      |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                |
|              | maskChannelInput | none          | The channel to use as a matte. By default, the transform is limited to the non-black areas of this channel.                                  |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream. |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel, so that the transform is limited to the non-white areas of the mask.                                    |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.                                                                                 |
|              |                  |               | When disabled, the effect is applied to the entire mask.                                                                                     |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                                          |

# VectorCornerPin

The VectorCornerPin node takes paint or an image from a reference frame and propagates it through the rest of the sequence using the motion vectors generated by the SmartVector node. This node, similar to CornerPin2D, allows you to set keyframes on the image, but uses vector information from SmartVector rather than tracking information to drive the warp.

See [SmartVector](#) and [CornerPin2D](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                             |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | Source          | The sequence containing the paint corrections or image and the source of the motion vectors.                                                         |
|                 | SmartVector     | The motion vectors generated by the SmartVector node. You can connect the SmartVector directly or read in the <b>.exr</b> files created by the node. |

| Control (UI)      | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# VectorDistort

The VectorDistort node takes the paint from a reference frame and propagates it through the rest of the sequence using the motion vectors generated by the SmartVector node.

See also [SmartVector](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                         |
|-----------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | Source          | The sequence containing the paint corrections and the source of the motion vectors.                                                              |
|                 | SmartVector     | The motion vectors generated by SmartVector node. You can connect the SmartVector directly or read in the <b>.exr</b> files created by the node. |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|              |                  |               | <p>plus minor sharpening (as shown by the negative -y portions of the curve).</p> <ul style="list-style-type: none"> <li>• <b>Simon</b> - remapped pixels receive some smoothing, plus medium sharpening (as shown by the negative -y portions of the curve).</li> <li>• <b>Rifman</b> - remapped pixels receive some smoothing, plus significant sharpening (as shown by the negative -y portions of the curve).</li> <li>• <b>Mitchell</b> - remapped pixels receive some smoothing, plus blurring to hide pixelation.</li> <li>• <b>Parzen</b> - remapped pixels receive the greatest smoothing of all filters.</li> <li>• <b>Notch</b> - remapped pixels receive flat smoothing (which tends to hide moire patterns).</li> <li>• <b>Lanczos4, Lanczos6, and Sinc4</b> - remapped pixels receive sharpening which can be useful for scaling down. <b>Lanczos4</b> provides the least sharpening and <b>Sinc4</b> the most.</li> </ul> |

# New 3D System Nodes (Beta)

The new USD-based nodes, which supersede the Nuke's classic 3D nodes, deal with Nuke's 3D workspace, allowing you to set up a 3D composite for camera moves, set replacement, and other applications where you need to simulate a "real" dimensional environment.

These nodes are currently in the Beta phase so that we can gather artist feedback to improve the system before deprecating the classic 3D nodes.

Join us to help develop the future of 3D compositing workflows in Nuke:

<https://community.foundry.com/discuss/nuke3d>

## Axis

Axis nodes act as null objects by adding a new transformational axis to which other objects may be parented. Even when objects already have their own internal axes, it's sometimes useful to parent in a separate axis. For example, when an Axis node is parented to other objects in a scene, the node globally controls the scene - rotating the axis rotates all objects in the scene.

**Tip:** Axis's classic 3D system equivalent is the [Axis](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | axis            | An optional Axis node input. This links the position, rotation, scale, and skew of the transformed 3D object(s) to the Axis node, so that the transformation controls on the Axis node override the corresponding controls on this node.<br><br>If you've worked with other 3D applications, you may know the Axis node as a "null" or "locator" object. |
|                 | scene           | An optional input to import scene data.                                                                                                                                                                                                                                                                                                                  |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                 |
|-------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Axis Tab          |                  |               |                                                                                                                                                                                                                                                                                                                          |
| Import Scene Prim | import_enabled   | off           | When disabled, the camera is configured using the controls under <b>Local Xform</b> on the <b>Camera</b> tab. Enable <b>Import Scene Prim</b> if you want to read in camera information from a file or from the scene graph.                                                                                             |
| Import From       | import_source    | N/A           | When Import Scene Prim is enabled, determines where the camera is loaded from: <ul style="list-style-type: none"> <li>• <b>File Path</b> - a file on disk specified by the <b>File Path</b> control.</li> <li>• <b>Scene Input</b> - a scene graph location specified by the <b>Import Prim Path</b> control.</li> </ul> |
| Reload            | Reload           | N/A           | Click to reload the camera information from the specified file or scene graph location. <div>  <b>Warning:</b> Any local changes you have made are overwritten by the imported camera data when you click <b>Reload</b>. </div>       |
| File Path         | file             | none          | Sets the file path from which you intend to import camera information, if the <b>scene</b> input is not connected.                                                                                                                                                                                                       |
| Import Prim Path  | import_prim_path | none          | Sets the absolute scene graph path to the prim from which to import camera data.                                                                                                                                                                                                                                         |
| Output Prim Path  | prim_path        | none          | Sets the scene graph path for the new camera prim, such as <b>/Scene/Cameras/Camera1</b> .<br><br>If the output path is left blank, the node name is used with a preceding / (forward slash). For example, <b>/Camera1</b> .                                                                                             |
| Parent Type       | parent_prim_type | Xform         | Sets the type of prim to create if there are missing ancestors in the path.                                                                                                                                                                                                                                              |

| Control (UI)      | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------|---------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   |                     |               |  <b>Note:</b> Setting the <b>Parent Type</b> to <b>None</b> may cause some referenced objects to behave as if they don't exist.                                                                                                                                                                                                                                                                                                  |
| Passthrough       | passthrough_enabled | off           | <p>When enabled, this node does not create output prims or affect the incoming scene file or scene graph.</p> <p>Any controls affecting output transforms still affect direct node connections, but those transforms are not output to prims in the output scene.</p> <p>A simple use case for passthrough might be importing a transform from an input prim and modifying or re-parenting the transform using the <b>axis</b> input or <b>Local Parent Xform</b> controls without affecting the source prim.</p> |
| Merge Input Scene | merge_enabled       | off           | <p>When enabled, the input scene is merged with this node's output scene.</p> <div>  <b>Note:</b> If the output prim path matches an existing path in the input scene, this node overwrites the existing prim.         </div>                                                                                                                                                                                                  |
| Lock Read Frame   | lock_read_frame     | off           | <p>When enabled, only the frame specified in the <b>read_frame</b> control is read.</p> <p>When disabled, all frames are read.</p>                                                                                                                                                                                                                                                                                                                                                                                |
|                   | read_frame          | 0             | <p>When <b>lock_read_frame</b> is enabled, specify the frame number to read or use the <b>read_frame</b> animation control to read any frame speed curve.</p>                                                                                                                                                                                                                                                                                                                                                     |
| Lock Read View    | lock_read_view      | off           | <p>When enabled, only the view specified in the <b>read_view</b> control is read.</p> <p>When disabled, all views are read.</p>                                                                                                                                                                                                                                                                                                                                                                                   |

| Control (UI)  | Knob (Scripting)      | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|-----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | read_view             | main          | When <b>lock_read_view</b> is enabled, specify the view to read.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Frame: Origin | frame_origin          | 0             | <p>Sets the origin of the incoming frame range. Any frame rate change is scaled from this point allowing it to remain unchanged on the output frame slider.</p> <p>This can be very useful to keep an important frame in a time-warped range from shifting unexpectedly on the timeline. For example, if shot animation begins at frame 101, but there are some preroll keys at frames 50-100, then setting this control to 101 keeps that frame from changing when a frame rate change is applied, preserving the start of the shot.</p> |
| Rate          | frame_rate            | 24            | <p>Sets the frame rate (frames per second) used to sample the geometry file.</p> <p>If this rate is lower than the rate encoded in the file, animation is slowed down. For example, if the file was animated at 24 fps and <b>Rate</b> is set to 12, the animation is read at half speed.</p>                                                                                                                                                                                                                                             |
| Output Offset | frame_offset          | 0             | <p>Offsets the incoming keyframes in time by the number of frames specified. The offset is applied after any frame rate change.</p> <p>The offset shifts the final, possibly time-warped keyframes in the frame slider.</p>                                                                                                                                                                                                                                                                                                               |
| Xform Extract | decompose_xform_order | SRT           | Sets the preferred order of the output transformation operations when decomposing an imported matrix transform.                                                                                                                                                                                                                                                                                                                                                                                                                           |
|               | decompose_rot_order   | ZXY           | Sets the preferred order of the output rotation operations when decomposing an imported matrix transform.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| T             | translate_enable      | off           | When enabled, import the specified translation, rotation, and scale curves.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Control (UI)          | Knob (Scripting)       | Default Value | Function                                                                                                                                                                                                                                                                                                                                   |

| Pivot Translate | pivot_translate  | 0, 0, 0       | When you make changes to a 3D object’s position, scaling, skewing, and rotation, these occur from the location of the object’s origin point or pivot. The pivot translate and rotate x, y, and z controls allow you to move and rotate the pivot point as required - you can even move it outside of the object. Subsequent transformations applied then occur relative to the new pivot point location and rotation.<br><br>You can hold down <b>Ctrl/Cmd</b> and drag the pivot point to a new location in the 3D Viewer. |
| Pivot Rotate    | pivot_rotate     | 0, 0, 0       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Local Matrix    |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Specify Matrix  | useMatrix        | N/A           | Enable this control to specify matrix values for the object you’re transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                                                                                                                                 |
| Matrix          | matrix           | N/A           | The matrix displays values from the object’s transform, rotate, scale, skew, and pivot controls.<br><br>Check <b>Specify Matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.                                                                                                                                                                                                                                              |
| World Matrix    |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| World matrix    | world_matrix     | N/A           | Displays the world or absolute xyz transform of the node in world coordinates. <div> <b>Note:</b> Unlike the <b>Local matrix</b>, you can’t adjust the <b>World matrix</b> manually.</div>                                                                                                                                                                                                                                               |
| Display Tab     |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Display         | display          | wireframe     | Adjust the display characteristics of the 3D object. These settings don’t affect the render output of the scene; these are for display purposes only in the 3D Viewer. <ul style="list-style-type: none"><li>• <b>off</b> - hides the 3D geometry object.</li></ul>                                                                                                                                                                                                                                                         |

# BasicSurface

This node creates a basic material that you can bind to a prim using the GeoBindMaterial node or the **img** input, if the prim has one. It combines the Diffuse, Specular, and Emission nodes, allowing you to control all three aspects of the material with a single node.

**Note:** To see the effect of your changes to an object's material properties, you need to have at least one light node in your Scene. You also need to enable transparency and lighting in the Viewer settings. Press **S** over the 3D Viewer, and check **transparency** and **headlamp** on the **3D** tab.

**Tip:** BasicSurface's classic 3D system equivalent is the [BasicMaterial](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | mapSh           | <p>An optional input for varying the shininess value. Where the mask is black, the shininess is set to the specified <b>min shininess</b> value. Where the mask is white, the shininess is set to the specified <b>max shininess</b> value. Values in between (where the matte is gray) are attenuated accordingly.</p> <div>  <b>Note:</b> This input is hidden on the left side of the node.         </div> |
|                 | mapS            | An optional input for limiting the effect of the specular component. Any changes you make to <b>specular</b> are limited to the non-black areas of the mask.                                                                                                                                                                                                                                                                                                                                   |
|                 | mapE            | An optional input for limiting the effect of the emissive component. Any changes you make to <b>emission</b> are limited to the non-black areas of the mask.                                                                                                                                                                                                                                                                                                                                   |
|                 | mapD            | An optional input for limiting the effect of the diffuse component. Any changes you make to <b>diffuse</b> are limited to the non-black areas of the mask.                                                                                                                                                                                                                                                                                                                                     |
|                 | unnamed         | Connects another shader node, such as ConstantShader or FillShader. Adding several shader nodes one after the other allows you to produce more complex effects.                                                                                                                                                                                                                                                                                                                                |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                              |

| BasicSurface Tab |                  |               |                                                                                                                                                                                                       |
| channels         | channels         | rgb           | <p>The effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| emission      | emission         | 0             | Sets the color of the light the material emits. Note that when you have an image connected to the unnamed input of the BasicSurface node and adjust this value, you need to look at the rendered 2D image to see the effect of your changes. Changing the emission value does not have any effect in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                   |
| diffuse       | diffuse          | 0.18          | Sets the color of the material when illuminated. Note that when you have an image connected to the unnamed input of the BasicSurface node and adjust this value, you need to look at the rendered 2D image to see the effect of your changes. Changing the diffuse value does not have any effect in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                   |
| specular      | specular         | 0.8           | Sets how bright the highlights on the material seem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| min shininess | min_shininess    | 10            | <p>Sets the shininess value controlling the width of the highlights. The higher the value, the wider the highlights.</p> <p>If you have connected a mask to the <b>mapSh</b> input of the node, pixel values in the mask are used to vary the shininess value. Where the matte is black, the shininess is set to <b>min shininess</b>. Where the matte is white, the shininess is set to <b>max shininess</b>. Values in between (where the matte is gray) are attenuated accordingly.</p> <p>If you're not using the <b>mapSh</b> input, the average of <b>min shininess</b> and the <b>max shininess</b> value is used as the shininess value for the material.</p> |
| max shininess | max_shininess    | 10            | <p>Sets the shininess value controlling the width of the highlights. The higher the value, the wider the highlights.</p> <p>If you have connected a mask to the <b>mapSh</b> input of the node, pixel values in the mask are used to vary the shininess value. Where the matte is black, the shininess is set to <b>min shininess</b>. Where the matte is white, the shininess is set to <b>max shininess</b>. Values in between (where the matte is gray) are attenuated accordingly.</p>                                                                                                                                                                            |

|                   |                   |               | If you're not using the <b>mapSh</b> input, the average of <b>min shininess</b> and the <b>max shininess</b> value is used as the shininess value for the material.                                                                                                                                                                                                                                                                                                                                                                                                     |
| shininess channel | shininess_channel | luminance     | <p>Selects which channel from the <b>mapSh</b> input is used to map the black and white values to the <b>min shininess</b> and <b>max shininess</b> controls. Choose:</p> <ul style="list-style-type: none"> <li>• <b>red</b> - use the red channel for the mapping.</li> <li>• <b>green</b> - use the green channel.</li> <li>• <b>blue</b> - use the blue channel.</li> <li>• <b>alpha</b> - use the alpha channel.</li> <li>• <b>luminance</b> - use the luminance.</li> <li>• <b>average rgb</b> - use the average of the red, green, and blue channels.</li> </ul> |

# Camera

Cameras can be connected to either the GeoScene node or the ScanlineRender node. Camera connected to a ScanlineRender node define the projection for use by the 3D renderer. You can connect additional cameras to the GeoScene node and switch between them by choosing the viewing camera from the dropdown menu at the top of the Viewer. You can also read in **.fbx**, **.abc**, and **.usd** scene files containing standard cameras, though only one camera per Camera node can be read.

Cameras can also be used to project 2D textures onto 3D objects in a scene using the controls on the **Projection** tab and a Project3D node.

**Tip:** Camera's classic 3D system equivalent is the [Camera](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | axis            | <p>An optional Axis node input. This links the position, rotation, scale, and skew of the transformed 3D object(s) to the Axis node, so that the transformation controls on the Axis node override the corresponding controls on this node.</p> <p>If you've worked with other 3D applications, you may know the Axis node as a "null" or "locator" object.</p> |
|                 | scene           | An optional input to import scene data.                                                                                                                                                                                                                                                                                                                         |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                        |
|-------------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Camera Tab        |                  |               |                                                                                                                                                                                                                                                                                                                                 |
| Import Scene Prim | import_enabled   | off           | <p>When disabled, the camera is configured using the controls under <b>Local Xform</b> on the <b>Camera</b> tab. Enable <b>Import Scene Prim</b> if you want to read in camera information from a file or from the scene graph.</p>                                                                                             |
| Import From       | import_source    | N/A           | <p>When Import Scene Prim is enabled, determines where the camera is loaded from:</p> <ul style="list-style-type: none"> <li>• <b>File Path</b> - a file on disk specified by the <b>File Path</b> control.</li> <li>• <b>Scene Input</b> - a scene graph location specified by the <b>Import Prim Path</b> control.</li> </ul> |
| Reload            | Reload           | N/A           | Click to reload the camera information from the specified file or scene graph location.                                                                                                                                                                                                                                         |

| Lock Read Frame   | lock_read_frame  | off           | <p>When enabled, only the frame specified in the <b>read_frame</b> control is read.</p> <p>When disabled, all frames are read.</p>                                                                                                                                                                                                                                                                                                                                                                                                        |
|                   | read_frame       | 0             | When <b>lock_read_frame</b> is enabled, specify the frame number to read or use the <b>read_frame</b> animation control to read any frame speed curve.                                                                                                                                                                                                                                                                                                                                                                                    |
| Lock Read View    | lock_read_view   | off           | <p>When enabled, only the view specified in the <b>read_view</b> control is read.</p> <p>When disabled, all views are read.</p>                                                                                                                                                                                                                                                                                                                                                                                                           |
|                   | read_view        | main          | When <b>lock_read_view</b> is enabled, specify the view to read.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Frame: Origin     | frame_origin     | 0             | <p>Sets the origin of the incoming frame range. Any frame rate change is scaled from this point allowing it to remain unchanged on the output frame slider.</p> <p>This can be very useful to keep an important frame in a time-warped range from shifting unexpectedly on the timeline. For example, if shot animation begins at frame 101, but there are some preroll keys at frames 50-100, then setting this control to 101 keeps that frame from changing when a frame rate change is applied, preserving the start of the shot.</p> |

| Control (UI)          | Knob (Scripting)      | Default Value | Function                                                                                                                                                                                                                                                                                      |
|-----------------------|-----------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rate                  | frame_rate            | 24            | <p>Sets the frame rate (frames per second) used to sample the geometry file.</p> <p>If this rate is lower than the rate encoded in the file, animation is slowed down. For example, if the file was animated at 24 fps and <b>Rate</b> is set to 12, the animation is read at half speed.</p> |
| Output Offset         | frame_offset          | 0             | <p>Offsets the incoming keyframes in time by the number of frames specified. The offset is applied after any frame rate change.</p> <p>The offset shifts the final, possibly time-warped keyframes in the frame slider.</p>                                                                   |
| Xform Extract         | decompose_xform_order | SRT           | Sets the preferred order of the output transformation operations when decomposing an imported matrix transform.                                                                                                                                                                               |

| Transform Order | xform_order      | SRT           | Sets the operation order for scale (S), rotation (R), and translation (T). The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                             |
| Rotation Order  | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZXY, ZYX.                                                                                                                                                                                                                                                                                                                           |
| Translate       | translate        | 0, 0, 0       | Lets you translate the object along the x, y, and z axes. You can also adjust translate values by clicking and dragging the object in the 3D Viewer.                                                                                                                                                                                                                                                                         |
| Rotate          | rotate           | 0, 0, 0       | Lets you rotate the object around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                          |
| Scale           | scaling          | 1, 1, 1       | Lets you scale the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                           |
| Uniform Scale   | uniform_scale    | 1             | Lets you scale the object simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                            |
| Skew            | skew             | 0, 0, 0       | Lets you skew the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                            |
| Pivot Translate | pivot_translate  | 0, 0, 0       | <p>When you make changes to a 3D object's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot translate and rotate x, y, and z controls allow you to move and rotate the pivot point as required - you can even move it outside of the object. Subsequent transformations applied then occur relative to the new pivot point location and rotation.</p> |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                            |

|---------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Far                 | far              | 10000         | Adjusts the position, in scene units, of the camera's far clipping plane. Objects farther from the camera than this plane are not rendered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Window Translate uv | win_translate    | 0, 0          | Changes the position of the film negative without changing the position of the camera itself, providing unique perspective views not otherwise possible. The value is in the range [-1,1] and it's relative to the film size.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Window Scale uv     | win_scale        | 1, 1          | Scales the film negative.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Window Roll         | winroll          | 0             | Rotates the film negative (by degrees) without changing the camera axis rotation itself.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Focal Distance      | focal_point      | 2             | Sets the distance in scene units from the camera center at which the image is perfectly in focus. Only applies to depth of field rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Fstop               | fstop            | 16            | As in real world camera, fstop controls the amount of light that can reach the film negative. Only applies to depth of field rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Shutter             | shutter          | 0.5           | Sets how long the shutter should be open for when blurring motion. The value is in frames, so 0.5 is half a frame.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Shutter Offset      | shutteroffset    | start         | Controls how the shutter behaves with respect to the current frame value. It has four options: <ul style="list-style-type: none"> <li>• <b>centred</b> - centers the shutter around the frame. That is, open from <math>f - \text{shutter}/2</math> to <math>f + \text{shutter}/2</math>.</li> <li>• <b>start</b> - opens the shutter starting at the frame. That is, open from <math>f</math> to <math>f + \text{shutter}</math>.</li> <li>• <b>end</b> - closes the shutter at the frame. That is, open from <math>f - \text{shutter}</math> to <math>f</math>.</li> <li>• <b>custom</b> - opens the shutter at the time specified by the <b>shuttercustomoffset</b> control.</li> </ul> |

| Control (UI) | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                      |
|--------------|---------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | shuttercustomoffset | 0             | <p>When <b>shutteroffset</b> is set to <b>custom</b>, this controls the time that the shutter opens by adding it to the current frame.</p> <p>Values are in frames, so -0.5 would open the shutter half a frame before the current frame.</p> |
| Bias         | shutter_bias        | 0             | Biases samples toward shutter close or shutter open for stylized motion blur. 0+ range (where 0 is uniform blur).                                                                                                                             |

# CameraTracker

CameraTracker (NukeX and Nuke Studio only) is designed to provide an integrated camera tracking or matchmoving tool, allowing you to create a virtual camera whose movement matches that of your original camera. Tracking camera movement in a 2D footage enables you to add virtual 3D objects to your 2D footage.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                  |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | Source          | The sequence whose camera movement you want to track.                                                                                                                                                     |
|                 | Mask            | <p>An optional input to use as a mask. By default, feature tracking is limited to the non-black areas of the mask.</p> <p>The <b>Mask</b> input is hidden until the <b>Source</b> input is connected.</p> |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Undistort Input  | undistort           | off              | When enabled, the <b>Source</b> is undistorted based on the calculated lens.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Focal Length     | focalLengthType     | Unknown Constant | <p>Sets the focal length for the camera:</p> <ul style="list-style-type: none"> <li>• <b>Known</b> - select this option if the focal length is available and enter a value in the <b>Length</b> control.</li> <li>• <b>Approximate Varying</b> - select this option if an approximate focal length is available and enter keyframed focal length values in the <b>Length</b> control.</li> <li>• <b>Approximate Constant</b> - select this option if an approximate focal length is available and there is no zoom, and enter a focal length value in the <b>Length</b> control.</li> </ul> <div>  <p><b>Note:</b> CameraTracker attempts to refine the focal length during the solve if you select an <b>Approximate</b> option.</p> </div> <ul style="list-style-type: none"> <li>• <b>Unknown Varying</b> - select this option if the focal length is unknown and changing.</li> <li>• <b>Unknown Constant</b> - this is the default option. Use this option if the focal length is unknown and there is no zoom.</li> </ul> |
| Length           | knownFocalLength    | 50               | Sets the focal length for approximate and known solves. You can animate this control to define a varying focal length. The units are the same as those used for the <b>Film Back Size</b> (mm or inches).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Film Back Preset | filmBackSizePresets | Custom           | Sets the <b>Film Back Size</b> controls automatically, depending on which preset you choose.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Control (UI)         | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                         |
|----------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                      |                  |               | <p>The default setting allows you to enter your own settings manually.</p> <div>  <b>Tip:</b> You can add your own defaults by editing the <b>../NukeScripts/camerapresets.py</b> file in the Nuke installation package. </div> |
| Film Back Size<br>xy | filmBackSize     | 36,24         | Sets the size of the camera imaging sensor. Specify the units you want to use by selecting either millimeters or inches in the <b>Units</b> dropdown. The units should match the units used for the <b>Length</b> .                                                                                              |
| Units                | filmbackUnits    | mm            | Sets the unit of measure for the <b>Film Back Size</b> , either millimeters or inches.                                                                                                                                                                                                                           |
| Analysis             |                  |               |                                                                                                                                                                                                                                                                                                                  |
| Track                | trackFeatures    | N/A           | Click to begin auto-tracking using the controls specified in the <b>Settings</b> tab. Track defines a set of 2D feature tracks that correspond to fixed points, or features, in the scene.                                                                                                                       |
| Update Track         | updateTrack      | N/A           | Click to display a frame range dialog, allowing you to retrack part of the sequence, such as when you have extended the frame range or used some of the <b>Settings</b> tab <b>Tracking</b> refinement controls.                                                                                                 |
| Clear Tracks         | clearTrack       | N/A           | Click to clear all auto-tracking data. A confirmation message needs acknowledging before the action is completed.                                                                                                                                                                                                |
| Solve                | solveCamera      | N/A           | Click to begin calculating the solve using the controls specified in the <b>Settings</b> tab. Solve calculates the camera path and projection                                                                                                                                                                    |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                  |               | creating a 3D point for each 2D feature track within a minimum projection error, including auto-tracks, User Tracks, and tracks created from imported Trackers.                                                                                                                                                                                                                                   |
| Update Solve  | updateSolve      | N/A           | <p>Click to update the solve calculation, such as when you have extended the frame range or used some of the <b>Settings</b> tab <b>Solving</b> refinement controls.</p> <p>Recalculating the solve is handy when you want to see how good the solve is after you've refined it, without permanently deleting tracks. Recalculating the solve also recalculates stereo geometry.</p>              |
| Clear Solve   | resetSolve       | N/A           | Click to clear all solve data. A confirmation message needs acknowledging before the action is completed.                                                                                                                                                                                                                                                                                         |
| Error         | solveRMSE        | N/A           | Displays the RMS (root mean square) error of your solve, in pixels. As a general rule of thumb, if your solve reports an RMS projection rate higher than 1.0 pixel, you may want to consider fine-tuning your solve or tracking data.                                                                                                                                                             |
| per frame     | solveError       | N/A           | Displays the RMS (root mean square) error of your solve at each frame, in pixels.                                                                                                                                                                                                                                                                                                                 |
| Export        |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                   |

| Focal Length        | refineOptions        | off           | When enabled, clicking <b>Refine Solve</b> causes CameraTracker to finess the solve calculation using an updated <b>Focal Length</b> .                                                 |
| Position            | refineOptions        | off           | When enabled, clicking <b>Refine Solve</b> causes CameraTracker to finess the solve calculation using an updated camera position.                                                      |
| Rotation            | refineOptions        | off           | When enabled, clicking <b>Refine Solve</b> causes CameraTracker to finess the solve calculation using an updated camera orientation.                                                   |
| Delete Unsolved     | deleteInvalidTracks  | N/A           | Click to permanently delete tracks for which 3D points could not be calculated in the solve.                                                                                           |
| Delete Rejected     | deleteRejectedTracks | N/A           | Click to delete any tracks rejected by the threshold controls.                                                                                                                         |
| Delete Auto-tracks  | deleteAutoTracks     | N/A           | Click to delete all auto-tracks from the script, while retaining User Track and solve data. You can use this button to reduce the size of the script once you're happy with the solve. |
| Settings Tab        |                      |               |                                                                                                                                                                                        |
| Features            |                      |               |                                                                                                                                                                                        |
| Number of Features  | numberFeatures       | 150           | Sets the number of features to track in each frame - ideally you should use more than 100 tracks per frame.                                                                            |
| Detection Threshold | featureThreshold     | 0.1           | Sets the distribution of features over the input image. Low values track features evenly on all parts of the image.                                                                    |

| Control (UI)             | Knob (Scripting)     | Default Value | Function                                                                                                                                                                                                 |
|--------------------------|----------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Feature Separation       | featureSpearation    | 12            | Sets the distribution of features in relation to each other. High values spread features at even distances over the image.                                                                               |
| Refine Feature Locations | refineFeatures       | off           | When enabled, lock detected features to local corners. CameraTracker finds the closest corner point in your footage and locks feature points to them.                                                    |
| Preview Features         | previewFeatures      | off           | When enabled, preview the potential features available for tracking. This allows you to check that the features cover the image. If not, tweak the tracking controls before tracking.                    |
| Tracking                 |                      |               |                                                                                                                                                                                                          |
| Minimum Length           | minTrackLength       | 3             | Sets a threshold value for the minimum track length to reject short tracks. You might find a lot of short tracks cropping up in long sequences with a slow camera movement.                              |
| Track Threshold          | matchThreshold       | 0.69999999    | Controls how similar features look over a number of frames. You can adjust this value to test whether a track is reliable.                                                                               |
| Track Smoothness         | smoothnessThreshold  | 0.1           | Sets the threshold for smooth track generation. Adjusting this value can be useful in preventing poor tracks in complex sequences. Increase the smoothness value to remove tracks that glitch over time. |
| Track Consistency        | consistencyThreshold | 0             | Sets the threshold for consistent track generation. Increase this value to ensure track motion is locally consistent. Adjust consistency to prevent poor tracks in complex sequences.                    |
| Solving                  |                      |               |                                                                                                                                                                                                          |
| Principal View           | principalView        | left          | Sets the principal view where features are                                                                                                                                                               |

| Control (UI)     | Knob (Scripting)   | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|--------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  |                    |               | <p>tracked and the <b>Mask</b> input is applied. The secondary camera is calculated relative to this <b>Principal View</b> camera.</p> <p>This control also appears on the <b>CameraTracker</b> tab.</p> <div>  <p><b>Note:</b> Principal View is only displayed if you have set up more than one view in your <b>Project Settings</b> (typically, if you're working on a stereoscopic project).</p> </div>                          |
| Camera Motion    | cameraMotion       | Free Camera   | <p>Sets the type of camera motion to compensate for:</p> <ul style="list-style-type: none"> <li>• <b>Rotation Only</b> - select this if the camera is stationary, but rotating.</li> <li>• <b>Free Camera</b> - select this if the camera is moving freely, rotating, and translating.</li> <li>• <b>Linear Motion</b> - select this if the camera motion is a straight, linear path.</li> <li>• <b>Planar Motion</b> - select this if the camera has a flat path, moving in a two-dimensional plane only.</li> </ul> |
| Keyframe Spacing | keyFrameSeparation | 0.30000001    | Controls the separation between keyframes. Use a high separation to spread keyframes out in long sequences with small camera movements. Use a low separation to generate more keyframes for fast camera moves.                                                                                                                                                                                                                                                                                                        |
| Smoothness       | motionSmoothness   | 0             | Adjusts the smoothness of your camera path. Increase this value to add weighting to the camera path and create a smoother result.                                                                                                                                                                                                                                                                                                                                                                                     |
| Reference Frame  | rootReferenceFrame | 0             | When <b>Set reference frame</b> is enabled, specifies the first frame to use as a keyframe                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Control (UI)                                                                                                                                                          | Knob (Scripting)               | Default Value | Function                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                                                       |                                |               | in the solve. This should be a frame where there is a large number of tracks distributed over the image with a good variation in depth.                                                                                                                   |
| Set reference frame                                                                                                                                                   | setRootFrame                   | off           | When enabled, use the Reference Frame field to manually define how keyframes are specified in the sequence. This can be useful if you have a difficult sequence to solve.                                                                                 |
| Stereo (These controls are only displayed if you have set up more than one view in your <b>Project Settings</b> , typically when working on a stereoscopic projects.) |                                |               |                                                                                                                                                                                                                                                           |
| Aligned Stereo Cameras                                                                                                                                                | alignSecondary Cameras         | on            | When enabled, the solve aligns secondary cameras to the principal camera position.                                                                                                                                                                        |
| Constant Interaxial Distance                                                                                                                                          | constantInterAxial Distance    | on            | When enabled, a constant interaxial distance is maintained between views.                                                                                                                                                                                 |
| Interaxial Distance                                                                                                                                                   | interAxialDistance             | 1             | <p>Sets a known interaxial distance for stereo views to define the scene scale.</p> <p>This control is only displayed if you have set up more than one view in your <b>Project Settings</b> (typically, if you're working on a stereoscopic project).</p> |
| Constant Interaxial Coverage                                                                                                                                          | constantInterAxial Convergence | on            | When enabled, a constant interaxial convergence is maintained between views.                                                                                                                                                                              |

|              |                  |               | <p>onto a card in 3D, for example, to simulate camera lens distortion effects, such as barrel distortion</p> <p>Positive values make the card rounder, negative make the corners sharper.</p> |

# ConstantShader

The ConstantShader node is used to apply a material with constant color to a prim. ConstantShader has no inputs.

## Inputs and Controls

| Control (UI)       | Knob (Scripting) | Default Value | Function                                              |
|--------------------|------------------|---------------|-------------------------------------------------------|
| ConstantShader Tab |                  |               |                                                       |
| Color              | color            | 1             | Sets the color of the material applied to the prim.   |
| Opacity            | opacity          | 1             | Sets the opacity of the material applied to the prim. |

# DepthGenerator

The DepthGenerator node (NukeX and Nuke Studio only) allows you to generate a depth map from your footage. The node uses information from a tracked camera to create a channel that displays variations in depth.

A depth map is an image that uses the brightness of each pixel to specify the distance between the 3D scene point and the virtual camera used to capture the scene.

DepthGenerator also allows you to output depth as normals and position passes, and create a [Card3D](#) node positioned in 3D space and displaced according to the depth channel.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | Mask            | <p>The mask used to ignore areas of the source image. DepthGenerator expects alpha values of either 0 (for regions to use) or 1 (for regions to ignore).</p> <p>Depth can only be calculated where the real world 3D position of objects doesn't change. If there are moving objects in your <b>Source</b> footage, DepthGenerator is likely to struggle to create an accurate depth map for those regions. To prevent this, you can exclude moving foreground regions from the depth calculation by connecting a matte to this input and setting <b>Ignore Mask</b> in the DepthGenerator properties to the channel that contains the matte.</p> <p>The <b>Mask</b> input only appears once you've connected the other two inputs.</p> |
|                 | Camera          | A tracked Camera that matches the Source footage. If necessary, you can create one using the <a href="#">CameraTracker</a> node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|                 | Source          | The source footage from which the Camera track was derived.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Control (UI)       | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                          |

|------------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------|
| Far Clip Plane   | far              | 10000         | Sets the maximum z depth. All depth values that are higher than this number are set to this value.                   |
| Mark Bad Regions | markRegions      | disabled      | When enabled, the regions where the depth calculation is ambiguous are marked in the depth map as very large values. |

# DepthToPosition

DepthToPosition takes depth data contained in an image file and the camera data to create a 2D position (xyz) pass. This pass is created by projecting the depth through the camera and recording the xyz positions of each projected point. The DepthToPosition node can be used together with the PositionToPoints node to create a point cloud, similar to the effect achieved with the DepthToPoints node.

**Tip:** DepthToPosition's classic 3D system equivalent is the [DepthToPosition](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                   |
|-----------------|-----------------|--------------------------------------------------------------------------------------------|
| Input           | camera          | The 3D tracked camera that corresponds to the image input.                                 |
|                 | image           | The image from which the position pass is generated, and where all the depth data resides. |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DepthToPosition Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                   |
| Output              | output           | rgb           | Specifies the channels the output position pass is put into, and includes the option to create a new layer for this purpose.                                                                                                                                                                                                                                      |
| Depth               | depth            | depth.Z       | <p>Sets the channel from the <b>image</b> input from which you want to take the depth data.</p> <div>  <b>Note:</b> The depth information must be in the 1/Z format, where depth is 1 divided by input depth. Nuke and RenderMan use this depth calculation by default. </div> |
| Invert Depth        | invert           | off           | Invert the depth before processing the depth pass image. If the data in the depth channel is in the Z format, rather than the required 1/Z format, you can enable <b>invert depth</b> to convert the depth data.                                                                                                                                                  |
| Far                 | far              | 10000         | Specifies a value beyond which depth values from the camera are ignored when calculating the position pass.                                                                                                                                                                                                                                                       |

## DirectLight

DirectLights emit parallel light in one direction and appear to illuminate all objects with equal intensity, as if it was coming from a far away source. For example, you can use direct light to simulate sunlight and moonlight. Being at an infinite distance from the objects, direct light has orientation, but no position. To generate accurate shadows from a direct light, view the scene through the light (using the Viewer's camera dropdown menu, just like a camera) and adjust the DirectLight's **Scale** controls so that the part of the scene that should cast shadows fits within the view. This ensures that none of the shadow-casting geometry is missed by the depth map.

See also [EnvironmentLight](#), [PointLight](#), and [SpotLight](#).

 **Tip:** DirectLight's classic 3D system equivalent is the [Direct](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | look            | An optional input to force the light to "look" at an Axis node.                                                                                                                                                                                                                                                                                                                                                                               |
|                 | axis            | An optional input to link the position, rotation, scale, and skew of the transformed 3D object(s) to an Axis node, so that the transformation controls on the Axis node override the corresponding controls on this node. <div> <b>Tip:</b> If you've worked with other 3D applications, you may know the Axis node as a "null" or "locator" object.</div> |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                      |

| Transform Order | xform_order      | SRT           | Sets the operation order for scale (S), rotation (R), and translation (T). The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                                                 |
| Rotation Order  | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZYX.                                                                                                                                                                                                                                                                                                                                                    |
| Translate       | translate        | 0, 0, 0       | Lets you translate the object along the x, y, and z axes. You can also adjust translate values by clicking and dragging the object in the 3D Viewer.                                                                                                                                                                                                                                                                                             |
| Rotate          | rotate           | 0, 0, 0       | Lets you rotate the object around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                              |
| Scale           | scaling          | 1, 1, 1       | Lets you scale the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                               |
| Uniform Scale   | uniform_scale    | 1             | Lets you scale the object simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                |
| Skew            | skew             | 0, 0, 0       | Lets you skew the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                |
| Pivot Translate | pivot_translate  | 0, 0, 0       | When you make changes to a 3D object's position, scaling, skewing, and rotation, these occur from the                                                                                                                                                                                                                                                                                                                                            |

| Control (UI)                                                                                                                                                                                     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                                                                                  |                  |               | location of the object's origin point or pivot. The pivot translate and rotate x, y, and z controls allow you to move and rotate the pivot point as required - you can even move it outside of the object. Subsequent transformations applied then occur relative to the new pivot point location and rotation. |
| Pivot Rotate                                                                                                                                                                                     | pivot_rotate     | 0, 0, 0       | You can hold down <b>Ctrl/Cmd</b> and drag the pivot point to a new location in the 3D Viewer.                                                                                                                                                                                                                  |

| bias               | depthmap_bias       | 0.01          | <p>Sets the bias for the raytracing or shadow map. Increase this value if self shadowing artifacts appear in the image. This moves the surface sample point away from surface. Note, however, that if you increase the value too much, some shadows may start moving away from the base of the objects that cast them.</p> <p>This control is only relevant when <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p>                                                                                                                                                                                                                    |
| slope bias         | depthmap_slope_bias | 0.01          | <p>Bias for the shadow map. This is like <b>bias</b>, but the offset is proportional to the slope of the depth map. This allows you to give a different offset to each value in the depth map, depending on the surface's slope relative to the light.</p> <p>If increasing <b>bias</b> reduced the existing self-shadowing artifacts but introduced more artifacts in other areas of the image, you may want to bring <b>bias</b> down a little and increase <b>slope bias</b> instead.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p> |
| clipping threshold | clipping_threshold  | 0.5           | <p>Objects that are set to cast shadows are considered transparent if their alpha is below the value set here.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>clipped alpha</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                           |
| jitter scale       | shadow_jitter_scale | 3             | <p>Sets the amount of jitter used when doing percentage-closer filtering (PCF) for soft shadows. A larger <b>jitter scale</b> value results in softer, more perceptually accurate shadows.</p> <p>PCF works by sampling the depth map at many different positions around the same spot. The final shadow value</p>                                                                                                                                                                                                                                                                                                                                         |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     |                  |               | <p>for that spot is an average of how many of the samples were occluded or visible from point of view of the light.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p>                                                                                                                                                          |
| depthmap resolution | depthmap_width   | 1024          | <p>Sets the resolution of the depth map. Larger values will result in a less crunchy edge, but will require more time to process.</p> <p>Note that you can also fix crunchy edges by increasing the number of <b>samples</b> instead of increasing the depth map resolution.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p> |
| output mask         | shadow_mask      | off           | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                       |
|                     |                  | none          | Sets the channel you want to output the shadow map into. This can be enabled even if the <b>cast shadows</b> box is disabled.                                                                                                                                                                                                                                                                                                                  |

# EnvironmentLight

EnvironmentLights illuminate objects using an image of light from a real-world environment. This image-based lighting is generated using High Dynamic Range (HDR) images.

To use an environment light, you first need to shoot a real life environment as an HDR image. Using the SphericalTransform node, you then convert this image into a spherical mapped image. The sphere is used to surround the 3D objects, so that the mapped image color illuminates them.

Environment light only works with shiny object materials that can reflect the mapped image. It results in a very realistic lighting that makes it easier to integrate the objects into the environment.

See also [DirectLight](#), [PointLight](#), and [SpotLight](#).

**Tip:** EnvironmentLight's classic 3D system equivalent is the [Environment](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                  |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | look            | An optional input to force the light to "look" at an Axis node.                                                                                                                                                           |
|                 | axis            | An optional input to link the position, rotation, scale, and skew of the transformed 3D object(s) to an Axis node, so that the transformation controls on the Axis node override the corresponding controls on this node. |

**Tip:** If you've worked with other 3D applications, you may know the Axis node as a "null" or "locator" object.

| Control (UI)             | Knob (Scripting)         | Default Value | Function                                                      |

The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Rotation Order                                                                    | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Translate                                                                         | translate        | 0, 0, 0       | Lets you translate the object along the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                  |               | You can also adjust translate values by clicking and dragging the object in the 3D Viewer.                                                                                                                                                                                                                                                                                                                            |
| Rotate          | rotate           | 0, 0, 0       | Lets you rotate the object around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                   |
| Scale           | scaling          | 1, 1, 1       | Lets you scale the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                    |
| Uniform Scale   | uniform_scale    | 1             | Lets you scale the object simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                     |
| Skew            | skew             | 0, 0, 0       | Lets you skew the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                     |
| Pivot Translate | pivot_translate  | 0, 0, 0       | When you make changes to a 3D object's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot translate and rotate x, y, and z controls allow you to move and rotate the pivot point as required - you can even move it outside of the object. Subsequent transformations applied then occur relative to the new pivot point location and rotation. |
| Pivot Rotate    | pivot_rotate     | 0, 0, 0       | You can hold down <b>Ctrl/Cmd</b> and drag the pivot point to a new location in the 3D Viewer.                                                                                                                                                                                                                                                                                                                        |
| Local Matrix    |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                       |
| specify matrix  | useMatrix        | N/A           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                           |
| matrix          | matrix           | N/A           | The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.<br><br>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.                                                                                                                                        |
| World Matrix    |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Control (UI)                                                                                                                                                                                   | Knob (Scripting) | Default Value | Function                                                                       |

| matrix                                                                                                                                                                                         | matrix           | N/A           | Displays the world or absolute xyz transform of the node in world coordinates. |
| <div>  <b>Note:</b> Unlike the <b>Local matrix</b>, you can't adjust the <b>World matrix</b> manually. </div> |                  |               |                                                                                |

# FillShader

The FillShader node replaces selected material channels with a constant color.

**Tip:** FillShader's classic 3D system equivalent is the [FillMat](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                           |

# GeoBindMaterial

The GeoBindMaterial node binds a material in the scene to all the objects specified in the **Mask** control. For example, connecting a Checkerboard node to the GeoBindMaterial **mat** input assigns the checkerboard material to a prim in the scene, such as /GeoCube1. If nothing is connected to the **mat** input, you can assign a material or shader from the Scene Graph using the **Material** control.

**Tip:** GeoBindMaterial's classic 3D system equivalent is the [ApplyMaterial](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                    |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene you want to affect.                                                                                                                                                                                         |
|                 | mat             | An optional input supplying the material or shader you want to apply to the specified prims. If nothing is connected to the mat input, specify the material or shader to apply using a Scene Graph location in the <b>Material</b> control. |

| Control (UI)    | Knob (Scripting) | Default Value  | Function                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GeoBindMaterial |                  |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Mask            | mask_patterns    | {lastmodified} | Specifies the mask pattern to match the prim names to affect. The default mask, <b>{lastmodified}</b> , affects whatever was changed by the previous node. A simple way to think of it is that <b>{lastmodified}</b> affects the node above. You can use standard glob-style variables, such as <b>/*</b> , to create masks or use individual prim names separated by spaces. For example, <b>/GeoCube 1 /GeoCard3</b> affects only those prims. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                 |
|--------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               |  <b>Tip:</b> You can also use the cog menu, the Viewer picker, or drag and drop paths from the Scene Graph to create masks.                                                                                                             |
| Material     | material_path    | none          | Assigns a material or shader from the Scene Graph if nothing is connected to the <b>mat</b> input.<br><br> <b>Tip:</b> You can also use the cog menu, the Viewer picker, or drag and drop paths from the Scene Graph to bind materials. |

# GeoCard

The GeoCard node creates a card object in the scene with a prim path variable **{parent}/{nodename}** which is equal to the node name, such as /GeoCard1 or /GeoCard5. You can change the prim path to update the scene graph as required and set the objects **Kind**, **Purpose**, and **Visibility**.

Nuke only uses **Kinds** with the [GeoDrawMode](#) node, which allows you to display complicated geometry in a simplified form, such as a bounding box or crossed cards, to load scenes faster. It's also good practice to follow the conventions on the use of **Kind** to create properly-constructed USD stages if you intend to export the scene for use in your pipeline.

The **Purpose** dropdown controls the type of geometry this object represents. The Viewer node's **Properties** > **3D** tab controls which purposes are visible in the 3D Viewer: **Render**, **Proxy**, or **Guide**. The **default** option essentially means 'always render this object', it has no special properties as far as renderers are concerned.

**Visibility** affects whether the object is visible or invisible when you export the scene. The default value is **inherited**, meaning the object's visibility is controlled by its parent object. You can set the cube's appearance using the color and opacity controls and the rows/columns settings determine how many vertices the object is split into. **Subdivision** determines how smoothing affects the object. The level of subdivision can be adjusted using the Viewer node's **Properties** on the **3D** tab under **Refine Level**. The **Refine Level** only affects the Viewer output, not the final rendered scene.

The **Transform** tab allows you to translate, rotate, and scale the object locally, rather than using a dedicated GeoTransform node. The **Lens Distortion** tab enables you to warp the card for use in lens distortion workflows including barrel and pincushion distortion depending on the slider values. You can also warp the card manually using the controls on the **Deform** tab. The **bilinear** deformation **type** allows you to make simple adjustments to the card's shape in 3D space, whereas **bicubic** gives you more flexibility with the addition of handles on each control point to adjust the curve of edges.

See also [GeoCube](#) and [GeoRevolve](#).

**Tip:** GeoCard's classic 3D system equivalent is the [Card](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                           |
|-----------------|-----------------|--------------------------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene to which you want to add geometry. |
|                 | mat             | The file containing the material you want to apply to the object.  |

| Control (UI)                                                                                                                                                                                                                            | Knob (Scripting) | Default Value | Function                                                                                                                                                             |

The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Rotation Order                                                                    | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Translate                                                                         | translate        | 0, 0, 0       | Lets you translate the object along the x, y, and z axes. You can also adjust translate values by clicking and dragging the object in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Rotate                                                                            | rotate           | 0, 0, 0       | Lets you rotate the object around the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Control (UI)        | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------|-------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     |                   |               | You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                           |
| Scale               | scaling           | 1, 1, 1       | Lets you scale the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                    |
| Uniform Scale       | uniform_scale     | 1             | Lets you scale the object simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                     |
| Skew                | skew              | 0, 0, 0       | Lets you skew the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                     |
| Pivot Translate     | pivot_translate   | 0, 0, 0       | When you make changes to a 3D object's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot translate and rotate x, y, and z controls allow you to move and rotate the pivot point as required - you can even move it outside of the object. Subsequent transformations applied then occur relative to the new pivot point location and rotation. |
| Pivot Rotate        | pivot_rotate      | 0, 0, 0       | You can hold down <b>Ctrl/Cmd</b> and drag the pivot point to a new location in the 3D Viewer.                                                                                                                                                                                                                                                                                                                        |
| Local Matrix        |                   |               |                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Specify Matrix      | use_matrix        | off           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                           |
| Matrix              | matrix            | N/A           | The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.<br><br>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.                                                                                                                                        |
| Lens Distortion Tab |                   |               |                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Lock to Vertical    | use_vertical_lock | off           | When enabled, the distortion is limited to the width, vertical distortion is locked.                                                                                                                                                                                                                                                                                                                                  |

# GeoCollection

The GeoCollection node creates a collection attribute on an object. Enter an object, a list of paths and a collection name, and a collection is created on the object containing the paths. This can then be used later on in a path expression as a shortcut to refer to the paths. For example, you might create collections for all the lights or cameras in the scene or any prims that have shadows cast on them.

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene you want to affect. |

| Control (UI)    | Knob (Scripting) | Default Value  | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GeoCollection   |                  |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Mask            | mask_patterns    | {lastmodified} | <p>Specifies the mask pattern to match the prim names to affect. The default mask, <b>{lastmodified}</b>, adds whatever was changed by the previous node to the collection. A simple way to think of it is that <b>{lastmodified}</b> affects the node above. You can use standard glob-style variables, such as <b>/*</b>, to create masks or use individual prim names separated by spaces. For example, <b>/PointLight1 /SpotLight1_3</b> adds only those prims.</p> <div>  <b>Tip:</b> You can also use the cog menu, the Viewer picker, or drag and drop paths from the Scene Graph to create masks. </div> |
| Collection Name | collection_name  | none           | Sets the name of the collection to create and authors a collection token in the USD source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Includes        | includes         | none           | Specifies prims to explicitly include from the collection. For example, <b>//PointLight*</b> adds all PointLights to the collection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Excludes        | excludes         | none           | Specifies prims to explicitly exclude from the collection. For example, <b>/PointLight1</b> explicitly excludes PointLight1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Collection Workflow Example

This simple example creates a cube, duplicates the cube using GeoInstance, and then passes GeoScope and GeoCollection information to a GeoPrune to remove instances of the cube starting with **/GeoCube1\_3\*** from the scene.

### Pruning Cube Duplicates by Collection

```

1  set cut_paste_input [stack 0]
2  push $cut_paste_input
3  GeoCube {
4    setAuthorMode {display_color set}
5    display_color {1 0.749311 0.020768}
6    display_color_panelDropped true
7    name GeoCube1
8    xpos 195
9    ypos -249
10 }
11 GeoInstance {
12   count 4
13   translate {1.889999986 0 0}
14   name GeoInstance1
15   xpos 195
16   ypos -225
17 }
18 GeoInstance {
19   translate {0 0 1.889999986}
20   name GeoInstance2
21   xpos 195
22   ypos -201
23 }
24 GeoScope {
25   prim_path /collections
26   name GeoScope2
27   xpos 195
28   ypos -177
29 }
30 GeoCollection {
31   mask_patterns /collections
32   collection_name cubes
33   includes /GeoCube1_3*
34   name GeoCollection2
35   xpos 195
36   ypos -153
37 }
38 GeoPrune {
39   mask_patterns "%/collections:cubes"
40   name GeoPrune2
41   xpos 195
42   ypos -129
43 }
44 Viewer {
45   frame_range 1-100
46   gl_lighting true
47   monitorOutOutputTransform rec709

```

```

48 |   name Viewer1
49 |   xpos 195
50 |   ypos -105
51 | }

```

# GeoCube

The GeoCube node creates a cube object in the scene with a prim path variable **{parent}/{nodename}** which is equal to the node name, such as /GeoCube1 or /GeoCube5. You can change the prim path to update the scene graph as required and set the object's **Kind**, **Purpose**, and **Visibility**.

Nuke only uses **Kinds** with the [GeoDrawMode](#) node, which allows you to display complicated geometry in a simplified form, such as a bounding box or crossed cards, to load scenes faster. It's also good practice to follow the conventions on the use of **Kind** to create properly-constructed USD stages if you intend to export the scene for use in your pipeline.

The **Purpose** dropdown controls the type of geometry this object represents. The Viewer node's **Properties** > **3D** tab controls which purposes are visible in the 3D Viewer, **Render**, **Proxy**, or **Guide**. The **default** option essentially means 'always render this object', it has no special properties as far as renderers are concerned.

**Visibility** affects whether the object is visible or invisible when you export the scene. The default value is **inherited**, meaning the object's visibility is controlled by its parent object. You can set the cube's appearance using the color and opacity controls and the rows/columns settings determine how many vertices the object is split into.

Setting the **Mesh Type** to **shared vertices** and choosing a **Subdivision** option allows you to smooth the object. The level of subdivision can be adjusted using the Viewer node's **Properties** on the **3D** tab under **Refine Level**. The **Refine Level** only affects the Viewer output, not the final rendered scene.

The **Transform** tab allows you to translate, rotate, and scale the object locally, rather than using a dedicated GeoTransform node.

See also [GeoCard](#) and [GeoRevolve](#).

**Tip:** GeoCube's classic 3D system equivalent is the [Cube](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                           |
|-----------------|-----------------|--------------------------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene to which you want to add geometry. |
|                 | mat             | The file containing the material you want to apply to the object.  |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                      |
| Rotation Order  | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZXY, ZYX.                                                                                                                                                                                                                                                                                                                    |
| Translate       | translate        | 0, 0, 0       | Lets you translate the object along the x, y, and z axes. You can also adjust translate values by clicking and dragging the object in the 3D Viewer.                                                                                                                                                                                                                                                                  |
| Rotate          | rotate           | 0, 0, 0       | Lets you rotate the object around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                   |
| Scale           | scaling          | 1, 1, 1       | Lets you scale the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                    |
| Uniform Scale   | uniform_scale    | 1             | Lets you scale the object simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                     |
| Skew            | skew             | 0, 0, 0       | Lets you skew the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                     |
| Pivot Translate | pivot_translate  | 0, 0, 0       | When you make changes to a 3D object's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot translate and rotate x, y, and z controls allow you to move and rotate the pivot point as required - you can even move it outside of the object. Subsequent transformations applied then occur relative to the new pivot point location and rotation. |
| Pivot Rotate    | pivot_rotate     | 0, 0, 0       | You can hold down <b>Ctrl/Cmd</b> and drag the pivot point to a new location in the 3D Viewer.                                                                                                                                                                                                                                                                                                                        |
| Local Matrix    |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Specify Matrix  | use_matrix       | off           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                           |
| Matrix          | matrix           | N/A           | The matrix displays values from the object's transform,                                                                                                                                                                                                                                                                                                                                                               |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                               |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | rotate, scale, skew, and pivot controls.<br><br>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene. |

# GeoDisplace

The GeoDisplace node moves each vertex along the normal to the surface according to channels in a texture map connected to the **displace** input. You can use displacement to quickly add detail to geometry without modeling it manually. This simple example shows using a CheckerBoard to displace the vertices on a card to create a bumpy surface.

**Tip:** GeoDisplace's classic 3D system equivalent is the [DisplaceGeo](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                             |
|-----------------|-----------------|------------------------------------------------------|
| Input           | displace        | The image you want to use to modify the 3D geometry. |
|                 | unnamed         | The previous stage in the scene you want to affect.  |

| Control (UI) | Knob (Scripting) | Default Value  | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GeoDisplace  |                  |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Mask         | mask_patterns    | {lastmodified} | <p>Specifies the mask pattern to match the prim names to affect. The default mask, <b>{lastmodified}</b>, applies the effect to whatever was changed by the previous node. A simple way to think of it is that <b>{lastmodified}</b> affects the node above. You can use standard glob-style variables, such as <b>/*</b>, to create masks or use individual prim names separated by spaces. For example, <b>/GeoCube 1 /GeoCard3</b> applies the effect to only those prims.</p> <div>  <b>Tip:</b> You can also use the cog menu, the Viewer picker, or drag and drop paths from the Scene Graph to create masks. </div> |
| Channels     | channels         | rgb            | <p>The <b>displace</b> input's channels to use for the displacement value.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Source       | source           | luminance      | <p>The source channel you want GeoDisplace to get a displacement map from. For example, if you selected <b>rgb</b> or <b>rgba</b> from the <b>channels</b> dropdown menu, you can use the red, green, or blue channel, or the pixel luminance as the source.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | <ul style="list-style-type: none"> <li>• <b>luminance, red, green, blue, alpha</b> - offset each vertex along its normal by the selected channel value supplied by the <b>displace</b> input.</li> <li>• <b>rgb absolute</b> - set each vertex's position to the XYZ position in the selected channel supplied by the <b>displace</b> input.</li> <li>• <b>rgb relative</b> - offset each vertex's current position by the XYZ position in the selected channel supplied by the <b>displace</b> input.</li> </ul>                                                                                                                                                         |
| Scale        | scale            | 0.1           | Increase or decrease the scale of the displacement. The higher the value, the bigger the displacement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Weight xyz   | weight           | 1, 1, 1       | To give x, y, and z scale different weightings, enter new weights the <b>weight</b> fields. By default, each weighting is set to 1. If you don't want to make changes to a value, set its weight to 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Offset xyz   | offset           | 0, 0, 0       | To offset x, y, and z values from the center of the geometry object, enter the value by which you want to offset them in the <b>offset</b> fields. For example, if you enter 0.5 in the <b>offset y</b> field, 0.5 is added to the y value.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Filter Size  | filter_size      | 5             | Change the size of the filter used to sample the <b>displace</b> input texture.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Filter       | filter           | Parzan        | <p>Select the filtering algorithm to use when remapping pixels from their original positions to new positions. This allows you to avoid problems with image quality, particularly in high contrast areas of the frame (where highly aliased, or jaggy, edges may appear if pixels are not filtered and retain their original values).</p> <ul style="list-style-type: none"> <li>• <b>Impulse</b> - remapped pixels carry their original values.</li> <li>• <b>Cubic</b> - remapped pixels receive some smoothing.</li> <li>• <b>Keys</b> - remapped pixels receive some smoothing, plus minor sharpening (as shown by the negative -y portions of the curve).</li> </ul> |

| Recalculate Normals | recalc_normals   | on            | <p>When enabled, recalculate the normals after the displacement. Normals are usually incorrect after vertices have been moved.</p> <p>When disabled, use the normal values after displacement without recalculating.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

# GeoDrawMode

The GeoDrawMode node sets the draw mode for objects with a **Kind** assigned, allowing you to display complicated geometry in a simplified form, such as a bounding box or crossed cards, to load scenes faster. It's also good practice to follow the conventions on the use of **Kind** to create properly-constructed USD stages if you intend to export the scene for use in your pipeline.

**Note:** Draw mode only works on objects that have their **Kind** set. Objects with no **Kind** assigned are unaffected.

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene you want to affect. |

| Control (UI) | Knob (Scripting) | Default Value  | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GeoDrawMode  |                  |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Mask         | mask_patterns    | {lastmodified} | Specifies the mask pattern to match the prim names to affect. The default mask, <b>{lastmodified}</b> , applies the draw mode to whatever was changed by the previous node. A simple way to think of it is that <b>{lastmodified}</b> affects the node above. You can use standard glob-style variables, such as <b>/*</b> , to create masks or use individual prim names separated by spaces. For example, <b>/GeoCube 1 /GeoCard3</b> applies the transform to only those prims. |

# GeoDuplicate

The GeoDuplicate node creates a copy of a prim that exists in the scene with a new user-defined scenegraph location. The new location is required because each object in USD must have a unique path, it doesn't allow more than one object to have the same path. You can use GeoDuplicate to reproduce the classic Nuke 3D system workflow of copying objects and merging them back into the scene.

See also [GeoMerge](#), [Geololate](#), and [GeoPrune](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene you want to affect. |

| Control (UI) | Knob (Scripting) | Default Value      | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Mask         | mask_patterns    | {lastmodified}     | <p>Specifies the mask pattern to match the prim names to affect. The default mask, <b>{lastmodified}</b>, applies the effect to whatever was changed by the previous node. A simple way to think of it is that <b>{lastmodified}</b> affects the node above. You can use standard glob-style variables, such as <b>/*</b>, to create masks or use individual prim names separated by spaces. For example, <b>/GeoCube 1 /GeoCard3</b> applies the effect to only those prims.</p> <div>  <b>Tip:</b> You can also use the scene graph popup, cog menu, Viewer picker, or drag and drop paths from the Scene Graph to create masks. </div> |
| Prim Path    | prim_path        | {path}_ {nodename} | <p>The root path of the new object. <b>Prim Path</b> defaults to the variable <b>{path}_{nodename}</b>, which is equal to the path plus the node name, such as <b>GeoCard1_GeoDuplicate1</b> or <b>GeoCard5_GeoDuplicate2</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Parent Type  | parent_type      | Xform              | <p>Sets the type of prim to create if there are missing ancestors in the path.</p> <div>  <b>Note:</b> Setting the <b>Parent Type</b> to <b>None</b> may cause some referenced objects to behave as if they don't exist. </div>                                                                                                                                                                                                                                                                                                                                                                                                           |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode         | mode             | Duplicate     | <p>Sets the duplication mode:</p> <ul style="list-style-type: none"> <li>• <b>Duplicate</b> - creates a standalone, flattened copy of the specified object. <b>Duplicate</b> can be computationally expensive because it includes flattened versions of all children of the specified object. Changes made to the source object do not affect the duplicate.</li> </ul> <div>  <p><b>Tip:</b> <b>Duplicate</b> mode flattens the incoming USD layers in order to create the duplicate because a prim could be defined across multiple USD files. In this case, Nuke can't define the duplicate object in the layers from which the original was derived. For example, the source layer might be a read-only layer loaded from disk.</p> </div> <ul style="list-style-type: none"> <li>• <b>Reference</b> - creates an instance of the specified object. <b>Reference</b> is computationally cheaper, as it is not flattened, and changes made to the source object are reflected in the referenced duplicate.</li> </ul> |

# GeoExport

The GeoExport node exports a flattened stage to a file. You can export USD files using the **.usd**, **.usdc**, and **.usda** file extensions.

**Note:** Writing the whole flattened stage is not a common workflow unless you are creating a stage from scratch with Nuke nodes.

**Tip:** GeoExport's classic 3D system equivalent is the [WriteGeo](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                        |
|-----------------|-----------------|-----------------------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene you want to flatten and export. |

| Control (UI)                                                                                                                                           | Knob (Scripting)  | Default Value | Function                                                                                                                                             |
|--------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| GeoExport                                                                                                                                              |                   |               |                                                                                                                                                      |

| Python Tab (These controls are for Python callbacks and can be used to have Python functions automatically called when various events happen in Nuke.) |                   |               |                                                                                                                                                      |
| Before Render                                                                                                                                          | beforeRender      | none          | These functions run prior to starting rendering in execute(). If they throw an exception, the render aborts.                                         |
| Before Each Frame                                                                                                                                      | beforeFrameRender | none          | These functions run prior to starting rendering of each individual frame. If they throw an exception, the render aborts.                             |
| After Each Frame                                                                                                                                       | afterFrameRender  | none          | These functions run after each frame is finished rendering. They are not called if the render aborts. If they throw an exception, the render aborts. |
| After Render                                                                                                                                           | afterRender       | none          | These functions run after rendering of all frames is finished. If they throw an error, the render aborts.                                            |
| Render Progress                                                                                                                                        | renderProgress    | none          | These functions run during rendering to determine progress or failure.                                                                               |

# GeoImport

The GeoImport node is used to import USD and Alembic objects from external **.usd** and **.abc** files into Nuke. GeoImport does not allow you to change the **Path** of the object in the scene graph so importing the same file more than once has no effect because the objects would be overwritten with the same data. If you want to import the same object multiple times, use the GeoReference node to create an instance, or light-weight copy, of the required objects.

See also [GeoReference](#).

**Tip:** GeoImport's classic 3D system equivalent is the [ReadGeo](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                          |
|-----------------|-----------------|-------------------------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene to which you want to add objects. |

| Time Remapping |                  |               |                                                                                                                                                                                                                                                                                                                                                                                        |
| Offset         | time_offset      | 0             | Offsets the USD prim animation by this amount                                                                                                                                                                                                                                                                                                                                          |
| Scale          | time_scale       | 1             | Scales the referenced prim animation by this amount. Values between 0 and 1 speed up the animation and values higher than 1 slow it down.                                                                                                                                                                                                                                              |

# GeoInstance

The GeoInstance node creates a number of instances of an object, allowing you to duplicate a prim multiple times. An instance is a reference to another object rather than a copy of it, so if the original is modified, the instances are also modified. GeoInstance has three **Instance Modes**:

- **reference** - creates a number of reference instances from the source object. You can modify an individual instance using its unique path in the Scene Graph, giving you full control of each instance.
- **instanceable reference** - similar to the **reference** mode, but computationally cheaper. You can use **instanceable reference** mode for small groups of referenced prims, such as cars and crowd scenes.
- **point instancer** - creates a single Scene Graph location containing all instances, which is computationally cheaper than **instanceable reference** mode, but the instances cannot be modified individually by downstream nodes. This mode is mostly useful for particles or other geometry with thousands of parts as you can only modify the whole instance at once.

GeoInstance includes options to control what happens to the source object and the number of instances created. The name of instances created is **{name}\_{index}** by default, which adds a number after the source prim name, such as GeoRevolve1\_1 and GeoRevolve1\_2.

The transform controls affect all the instances in the scene and are applied to each instance from the previous instance's position. The second instance is transformed and then the third instance is transformed by the same amount, but from the position of the second instance, and so on. For example, with a **Count** of **3** instances and **Rotate x** value of **30** in the **Properties** panel, the first instance is not affected, the second instance is rotated **30**, and the third instance is rotated **60**.

Three instances of a cube geometry.

The same three instances with a **Rotate x** value of 30.

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene you want to affect. |

| Control (UI) | Knob (Scripting) | Default Value  | Function                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------|------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GeoInstance  |                  |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Mask         | mask_patterns    | {lastmodified} | Specifies the mask pattern to match the prim names to affect. The default mask, <b>{lastmodified}</b> , instances whatever was changed by the previous node. A simple way to think of it is that <b>{lastmodified}</b> affects the node above. You can use standard glob-style variables, such as <b>/*</b> , to create masks or use individual prim names separated by spaces. For example, <b>/GeoCube 1 /GeoCard3</b> instances only those prims. |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Rotation Order                                                                    | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Translate                                                                         | translate        | 0, 0, 0       | Lets you translate the instanced objects along the x, y, and z axes. You can also adjust translate values by clicking and                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                  |               | dragging the object in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                                 |
| Rotate          | rotate           | 0, 0, 0       | Lets you rotate the instanced objects around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                        |
| Scale           | scaling          | 1, 1, 1       | Lets you scale the instanced objects on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                         |
| Uniform Scale   | uniform_scale    | 1             | Lets you scale the instanced objects simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                          |
| Skew            | skew             | 0, 0, 0       | Lets you skew the instanced objects on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                          |
| Pivot Translate | pivot_translate  | 0, 0, 0       | When you make changes to a 3D object's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot translate and rotate x, y, and z controls allow you to move and rotate the pivot point as required - you can even move it outside of the object. Subsequent transformations applied then occur relative to the new pivot point location and rotation. |
| Pivot Rotate    | pivot_rotate     | 0, 0, 0       | You can hold down <b>Ctrl/Cmd</b> and drag the pivot point to a new location in the 3D Viewer.                                                                                                                                                                                                                                                                                                                        |
| Local Matrix    |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Specify Matrix  | use_matrix       | off           | Enable this control to specify matrix values for the instanced objects you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                |
| Matrix          | matrix           | N/A           | The matrix displays values from the instanced object's transform, rotate, scale, skew, and pivot controls.<br><br>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.                                                                                                                              |

# Geololate

The Geololate node operates in a similar way to GeoPrune in that it also creates overrides for visibility and the active state, but the **Invert Selection** control is on by default.

You can then modify the isolated geometry and merge back to the main stage with the GeoMerge **Merge Mode** set to **Deisolate**. The isolated layer is merged in the same way as the **Merge Layers** mode, but any layers created by Geololate nodes are removed. The result is that your modifications persist when merged back to the main stage.

See also [GeoMerge](#), [GeoDuplicate](#), and [GeoPrune](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene you want to affect. |

| Control (UI)     | Knob (Scripting) | Default Value  | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|--------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | <p>hidden.</p> <ul style="list-style-type: none"> <li>• <b>deactivate</b> - the objects are temporarily disabled or turned off. Unlike hiding, a deactivated object is still considered during stage composition, but it is effectively inactive in the scene. This is commonly used to stop objects affecting a scene's behavior without removing them.</li> <li>• <b>activate</b> - the objects are reactivated if they were previously deactivated.</li> </ul> |

# GeoMerge

The GeoMerge node combines prims from different node branches and lets you manage how layers are merged. This node provides various options for merging layers giving control of subsequent exports.

You can then affect all objects attached to the GeoMerge at once. For example, you could add a GeoTransform downstream with the **Mask** set to **/\*** (forward-slash asterisk) to transform the entire scene in one operation. GeoMerge is functionally equivalent to GeoScene and does not have any node-specific properties.

**Note:** Prims downstream from GeoMerge with **Mask** set to **{lastmodified}** inherit from the strongest layer, the layer connected to the highest numbered input.

See also [GeoScene](#).

**Tip:** GeoMerge's classic 3D system equivalent is the [MergeGeo](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                     |
|-----------------|-----------------|--------------------------------------------------------------|
| Input           | numbered inputs | Combines any new 3D system prims you want to merge together. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Merge Mode Options

### Merge Layers

Combines the prims from one pipe with the prims of another pipe.

The default merge behavior is always "A over B" like the 2D Merge. The B input is the main pipe, and the A pipe provides overrides/duplicates. The A inputs are applied in numerical order so higher numbers override lower ones.

From a USD layers perspective, this adds all incoming layers to the layer stack.

Merge Layers: A simple example of merging two stacks.

Merge Layers is recommended as the default behavior for merging in the USD architecture. Different input scenarios provide different results...

### Scenario 1: Different stages are piped in from their own node branches

If you have multiple stages piped into the node from their own node branches (as in the diagram above), the layers will be merged so that they exist separately in the result. For example:

- the geometry of a building in pipe A
- the geometry of a character in pipe B

Merge Layers is most similar to how merging works in the classic 3D system.

### Scenario 2: The same stage is merged back to itself

Merging back to the same stage results in one of the pipes overriding the other as both stages have the same path name. You will not see two instances of the same geometry as in a hierarchical scenegraph prims cannot share the same path. Instead, the stage with the strongest opinion is shown.

Example 1:

- You have geometry from a building in pipe A.
- You have a transformed version of the same building in pipe B.
- You try to GeoMerge pipe A and pipe B.
- Result: pipe with the strongest opinion is shown. In this instance pipe B where we have transformed the building will be shown.

Example 2:

- You have geometry from a building in pipe A.
- You deactivate or hide geometry (using GeoPrune or Geololate) in the building for pipe B.
- You merge pipe A and pipe B using GeoMerge.
- Result: pipe with the strongest opinion is shown. In this instance pipe B where we have either deactivated or hidden the rest of the geometry in the stage.

**Note:** In USD, an 'opinion' is a way of determining how the USD stage is composed. For more information see the [Pixar USD reference](#).

## Merging Geometry From the Same Stage

For scenario 2 (above), where you want to merge modified geometry that is an offshoot of the same stage you can use the Geololate node and select **Deisolate** on merge. The Deisolate knob removes any layers created by Geololate nodes allowing you to modify geometry and merge without the rest of the stage being overwritten.

Alternatively, you can fall back on the traditional USD workflow and use a GeoReference node to generate a unique path name for the geometry and so avoid conflicts when merging.

## Duplicate Prims

Allows you to take a prim input and create a copy with a user-defined name.

This flattens all the layers on input A and duplicates their root prims. Input B is merged unchanged - only prims that exist on both branches are duplicated.

**Duplicate Prims:** The B input is merged intact and the A input is flattened using duplicate prims (the ' indicates a duplicate).

## Flatten Layers

Flattens layers from each input and adds the flattened layers to the layer stack.

**Flatten Layers:** Incoming layers are flattened and merged to form the result.

Use **Flatten layers** to merge different stages, flatten the layers, and stack the results.

## Flatten to Single Layer

Flattens the layers from each input into one single layer.

**Flatten to Single Layer:** All layers from the inputs are merged into a single layer.

Use Flatten to Single Layer when you want to merge the stages together into a stage containing a single flattened layer.

# GeoNoise

The GeoNoise node warps meshes using a Perlin noise function that creates seemingly random noise. For example, you could use this node to generate animated noise for rippling waves or clouds, or to create a terrain from a flat card.

**Tip:** GeoNoise's classic 3D system equivalent is the [ProceduralNoise](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene you want to affect. |

| Control (UI) | Knob (Scripting) | Default Value  | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GeoNoise     |                  |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Mask         | mask_patterns    | {lastmodified} | <p>Specifies the mask pattern to match the prim names to affect. The default mask, <b>{lastmodified}</b>, applies the transform to whatever was changed by the previous node. A simple way to think of it is that <b>{lastmodified}</b> affects the node above. You can use standard glob-style variables, such as <b>/*</b>, to create masks or use individual prim names separated by spaces. For example, <b>/GeoCube1 /GeoCard3</b> applies the transform to only those prims.</p> <div>  <b>Tip:</b> You can also use the cog menu, the Viewer picker, or drag and drop paths from the Scene Graph to create masks. </div> |
| Noise Type   | mode             | fBm            | <p>Choose the type of noise to use:</p> <ul style="list-style-type: none"> <li>• <b>Turbulence</b> is the same as <b>fBm</b> except it uses the absolute value of the noise function so the values it sums up are all between 0 and 1.</li> <li>• <b>fBm</b> (fractional Brownian motion) runs <b>noise()</b> octave times at different scales to get random numbers between -1 and +1 and then adds them up.</li> </ul>                                                                                                                                                                                                                                                                                           |
| Amount xyz   | amount           | 1, 1, 1        | Allows you to control the amount of noise applied to the prim on each axis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Control (UI)                                                                        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------------------------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                     |                  |               |  <b>Tip:</b> If you want to affect all axes equally, click the single/multiple value button on the right of the <b>Properties</b> panel to gang the xyz controls into a single <b>Amount</b> slider.                                                                                                                                                                                                                                                                                                                                                             |
| Octaves                                                                             | octaves          | 1             | Controls the amount of detail in the noise applied to the prim. Each increment has twice the frequency of the previous number. Lower values produce smoother, large scale noise and higher values more angular, small scale noise.                                                                                                                                                                                                                                                                                                                                                                                                                |
| Lacunarity                                                                          | lacunarity       | 2             | Controls the change in frequency between the specified number of <b>Octaves</b> . Lower values produce coarse noise and higher values finer, small scale noise.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Gain                                                                                | gain             | 0.5           | Controls the amount of noise gain applied to the prim. <b>Gain</b> essentially multiplies the noise effect applied to the prim.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Time                                                                                | time             | 0             | Adjusts the time coordinate on the noise, which produces the effect of noise evolving as time progresses. For example, applying GeoNoise to a GeoCard and adding a keyframe of <b>time=0</b> at frame 1 and <b>time=1</b> at frame 10 produces a wave effect.                                                                                                                                                                                                                                                                                                                                                                                     |
|  | file_menu        | N/A           | Select to import or export a channel file: <ul style="list-style-type: none"> <li>• <b>Import chan file</b> - import a channel file and transform the input object according to the transformation data in the channel file. Channel files contain a set of Cartesian coordinates for every frame of animation in a given shot. You can create and export them using Nuke or 3D tracking software, such as 3D-Equalizer, Maya, or Boujou.</li> <li>• <b>Export chan file</b> - export the translation parameters that you've applied to the input object as a channel file. This is a useful method of sharing setups between artists.</li> </ul> |

| Uniform                                                                           | uniform_         | 1             | Scales the noise simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                             |
|-----------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Scale           | scale            |               |                                                                                                                                                                                                                                                                                      |
| skew            | skew             | 0,0,0         | Skews the noise on the x, y, and z axes.                                                                                                                                                                                                                                             |
| Pivot Translate | pivot_translate  | 0,0,0         | Translates the pivot point and transform handles along the x, y, and z axes without affecting the objects in the scene. You can also translate the pivot point by holding down <b>Ctrl/Cmd</b> and dragging the axis in the 3D Viewer.                                               |
| Pivot Rotate    | pivot_rotate     | 0,0,0         | Rotates the pivot point and transform handles along the x, y, and z axes without affecting the objects in the scene. You can also rotate the pivot point by holding down <b>Ctrl/Cmd</b> and dragging the axis in the 3D Viewer.                                                     |
| Local Matrix    |                  |               |                                                                                                                                                                                                                                                                                      |
| Specify Matrix  | useMatrix        | off           | Enable this control to specify matrix values for the noise you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                           |
| matrix          | matrix           | N/A           | <p>The matrix displays values from the noise's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>Specify Matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p> |

# GeoNormals

The GeoNormals node creates or rebuilds mesh normals. Subdivision surfaces don't generally need normals, but there are occasional cases where creating or modifying normals is beneficial, such as when shaders need detailed lighting information to render correctly.

**Tip:** GeoNormals's classic 3D system equivalent is the [Normals](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                          |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | lookat          | <p>An optional input that points all normals at the object connected to this input and adds the <b>Normal</b> xyz values to that position.</p> <div>  <b>Note:</b> <b>Action</b> must be set to <b>lookat</b> for this input to work as expected.         </div> |
|                 | unnamed         | The previous stage in the scene you want to affect.                                                                                                                                                                                                                                                                                               |

| Control (UI) | Knob (Scripting) | Default Value  | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------|------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GeoNormals   |                  |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Mask         | mask_patterns    | {lastmodified} | <p>Specifies the mask pattern to match the prim names to affect. The default mask, <b>{lastmodified}</b>, adds or adjusts the normals for whatever was changed by the previous node. A simple way to think of it is that <b>{lastmodified}</b> affects the node above. You can use standard glob-style variables, such as <b>/*</b>, to create masks or use individual prim names separated by spaces. For example, <b>/GeoCube1 /GeoCard3</b> applies the transform to only those prims.</p> <div>  <b>Tip:</b> You can also use the cog menu, the Viewer picker, or drag and drop paths from the Scene Graph to create masks.         </div> |
| Action       | action           | unchanged      | <p>Determines what happens to any normals in prims selected by the <b>Mask</b> control:</p> <ul style="list-style-type: none"> <li>• <b>unchanged</b> - any normals specified in the <b>Attribute Name</b> are unaffected.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Control (UI)    | Knob (Scripting) | Default Value    | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                  |                  | <ul style="list-style-type: none"> <li>• <b>set</b> - assigns normals specified in the <b>Attribute Name</b> to a constant value set by the <b>Normal</b> control's xyz values.</li> <li>• <b>build</b> - rebuild each normal specified in the <b>Attribute Name</b> based on the surrounding vertices. The <b>Angle Threshold</b> determines the break angle where two faces no longer constitute a smooth surface.</li> <li>• <b>lookat</b> - points all normals specified in the <b>Attribute Name</b> at the object connected to the <b>lookat</b> input and adds the <b>Normal</b> xyz values to that position.</li> <li>• <b>delete</b> - removes the normals specified in the <b>Attribute Name</b> from all geometry groups.</li> </ul> |
| Invert          | invert           | off              | <p>Inverts the added or rebuilt normals.</p> <div>  <b>Note:</b> The <b>Invert</b> control affects all actions, even <b>unchanged</b>.         </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Angle Threshold | threshold        | 45               | <p>When <b>Action</b> is set to <b>build</b>, sets the angle between two faces at which vertex normals are broken, which creates sharp edges under lighting. A threshold of 0 means all faces are flat, and 180 means all faces are smooth.</p> <div>  <b>Note:</b> <b>Angle Threshold</b> only affects vertex normals.         </div>                                                                                                                                                                                                                                                                                                                       |
| Attribute Name  | N_attrib_name    | primvars:normals | Sets the name of the normal attribute affected by this node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

# GeoPoints

The GeoPoints node creates a point cloud from its input. GeoPoints performs similar functions to the classic 3D system DeepToPoints and PositionToPoints nodes, but can also create points from other types of input, such as meshes and particles.

**Tip:** GeoPoints's classic 3D system equivalents are the [DeepToPoints](#) and [PositionToPoints](#) nodes.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                           |
|-----------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | cam             | An optional input to connect a Camera node to project 2D points back into the 3D space. The image must contain a Z-depth channel if it does not include deep data. |
|                 | src             | An optional input to connect a source 3D object, 2D flat image source, or image containing deep data from which points are created.                                |
|                 | unnamed         | The previous stage in the scene you want to affect.                                                                                                                |
|                 | mat             | The file containing the material you want to apply to the object.                                                                                                  |

| Control (UI) | Knob (Scripting) | Default Value           | Function                                                                                                                                                                |
|--------------|------------------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GeoPoints    |                  |                         |                                                                                                                                                                         |
| Path         | prim_path        | {parent}/<br>{nodename} | The root path of the new object. <b>Path</b> defaults a prim path variable <b>{parent}/{nodename}</b> which is equal to the node name, such as GeoPoint1 or GeoPoints5. |
| Parent Type  | parentPrimType   | Xform                   | Sets the type of prim to create if there are missing ancestors in the path.                                                                                             |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Points         | points_path      | none          | <p>Specifies the prim names from which points are created. You can use standard glob-style variables, such as <code>/*</code>, to create masks or use individual prim names separated by spaces. For example, <code>/GeoCube1 /GeoCard3</code> creates points from only those prims.</p> <div>  <b>Tip:</b> You can also use the cog menu, the Viewer picker, or drag and drop paths from the Scene Graph to specify source prims. </div> |
| Surface Points | P_channel        | none          | Sets the channel from which the point positions are taken.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Surface Normal | N_channel        | none          | Sets the channel from which the point normals are taken.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Point Size     | point_size       | 0.01          | Controls the size of the points in the Viewer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Depth Channel  | depth_channel    | depth.Z       | Sets the channel from which depth information is taken.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Depth Type     | depth_type       | 1/Z           | <p>Sets how the depth information is converted into the distance between the camera and objects:</p> <ul style="list-style-type: none"> <li>• <b>Z</b> - depth is the input depth.</li> <li>• <b>1/Z</b> - depth is 1 divided by input depth. Nuke and RenderMan use this depth calculation by default.</li> <li>• <b>-Z</b> - depth is -input depth.</li> <li>• <b>-1/Z</b> - depth is -1 divided by input depth. Maya uses this depth calculation by default.</li> </ul>                                                 |

# GeoPointsToMesh

The GeoPointsToMesh node (NukeX only) uses geometry normals to generate a mesh from a point cloud using Poisson Surface Reconstruction.

**Note:** Based on the SGP 2006 paper, *Poisson Surface Reconstruction* by Michael Kazhdan, Matthew Bolitho, and Hugues Hoppe. The original source code and paper can be found at <https://www.cs.jhu.edu/~misha/Code/PoissonRecon>

**Tip:** GeoPointsToMesh's classic 3D system equivalent is the [PoissonMesh](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene you want to affect. |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                    |
|-----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GeoPointsToMesh |                  |               |                                                                                                                                                                                                                                                                                                             |
| Path            | prim_path        | none          | The root path of the new object. <b>Path</b> defaults a prim path variable <b>{parent}/{nodename}</b> which is equal to the node name, such as GeoPointsToMesh1 or GeoPointsToMesh5.                                                                                                                        |
| Parent Type     | parent_type      | Xform         | Sets the type of prim to create if there are missing ancestors in the path. <div>  <b>Note:</b> Setting the <b>Parent Type</b> to <b>None</b> may cause some referenced objects to behave as if they don't exist. </div> |
| Mask            | mask_patterns    | none          | Specifies the mask pattern to match the prim names from which the mesh is created. You can use standard glob-style variables, such as <b>/*</b> , to create masks or use individual prim names separated by spaces. For example, <b>/GeoCube1 /GeoCard3</b> applies the transform to only those prims.      |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                  |               |  <b>Tip:</b> You can also use the cog menu, the Viewer picker, or drag and drop paths from the Scene Graph to create masks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Use Selection | use_selection    | on            | When enabled, selection flags from GeoSelect nodes further up the tree are used to create the mesh.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Filtering     | use_filtering    | on            | When enabled, filter the new mesh so that only faces with normals similar to those of the input are created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Depth         | depth            | 8             | <p>Sets the maximum depth of the tree that is used for surface reconstruction. The <b>Depth</b> value must be an integer with a maximum value of 10, because each increment increases the solver's potential memory usage by 8 times, so keep it as low as possible.</p> <p>You can also think of it as the density of the voxels used by the solver. Running at depth <b>d</b> corresponds to solving on a voxel grid whose resolution is no larger than <math>2^d \times 2^d \times 2^d</math>.</p> <div>  <b>Note:</b> The reconstructor adapts the octree to the sampling density, so the specified reconstruction depth is only an upper bound.         </div> |
| Scale         | scale            | 1.25          | Specifies the ratio between the diameter of the cube used for reconstruction and the diameter of the samples' bounding cube.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Solver Divide | solver_divide    | 8             | Specifies the depth at which a block Gauss-Seidel solver is used to solve the Laplacian equation. Using this parameter helps reduce the memory overhead at the cost of a small increase in reconstruction time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  |                  |               |  <b>Tip:</b> We found that for reconstructions of <b>Depth</b> $\geq 9$ , a <b>Solver Divide</b> of <b>7</b> or <b>8</b> can greatly reduce memory usage.                                                                                                                                                                                                                                             |
| Iso Divide       | iso_divide       | 8             | <p>Specifies the depth at which a block iso-surface extractor is used to extract the iso-surface. <b>Iso Divide</b> helps reduce the memory overhead at the cost of a small increase in extraction time.</p> <div>  <b>Tip:</b> We found that for reconstructions of <b>Depth</b> <math>\geq 9</math>, an <b>Iso Divide</b> of <b>7</b> or <b>8</b> can greatly reduce memory usage.           </div> |
| Samples Per Node | samples_per_node | 1             | <p>Specifies the minimum number of sample points that fall within an octree node as the octree construction is adapted to sampling density.</p> <p>For noise-free samples, use small values in the range 1.0 - 5.0. For more noisy samples, larger values in the range 15.0 - 20.0 may provide a smoother, noise-reduced reconstruction.</p>                                                                                                                                           |
| Confidence       | confidence       | off           | <p>When enabled, the reconstructor uses the size of the normals as confidence information.</p> <p>When disabled, all normals are normalized to have a unit-length prior to reconstruction.</p>                                                                                                                                                                                                                                                                                         |

# GeoPrune

The GeoPrune node is used to show and hide objects in the scene or deactivate and active objects in the scene. Hide causes the specified objects to become invisible, whereas deactivate causes the specified objects to behave as though they haven't been added to the scene at all.

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene you want to affect. |

| Control (UI)     | Knob (Scripting) | Default Value  | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------|------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GeoPrune         |                  |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Mask             | mask_patterns    | {lastmodified} | <p>Specifies the mask pattern to match the prim names to prune from the scene. The default mask, <b>{lastmodified}</b>, applies the prune to whatever was changed by the previous node. A simple way to think of it is that <b>{lastmodified}</b> affects the node above. You can use standard glob-style variables, such as <b>/*</b>, to create masks or use individual prim names separated by spaces. For example, <b>/GeoCube 1 /GeoCard3</b> applies the prune effect to only those prims.</p> <div>  <b>Tip:</b> You can also use the cog menu, the Viewer picker, or drag and drop paths from the Scene Graph to create masks. </div> |
| Invert Selection | invert_mask      | off            | <p>When turned off the prune method is only applied to the objects specified in the <b>Mask</b> control.</p> <p>When turned on, the prune method is applied to all objects in the scene not specified in the <b>Mask</b> control.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Method           | method           | Hide           | <p>Sets the prune method to apply to objects:</p> <ul style="list-style-type: none"> <li>• <b>Hide</b> - hides the objects specified by the <b>Mask</b> pattern. Hidden objects behave as if they are invisible.</li> <li>• <b>Show</b> - shows the objects specified by the <b>Mask</b> pattern.</li> <li>• <b>Deactivate</b> - deactivates the objects specified by the <b>Mask</b> pattern. Deactivated objects behave as if they were</li> </ul>                                                                                                                                                                                                                                                                             |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                              |
|--------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | <p>never added to the scene.</p> <ul style="list-style-type: none"> <li>• <b>Activate</b> - Activates the objects specified by the <b>Mask</b> pattern. Activated objects behave normally.</li> </ul> |

# GeoRadialWarp

The GeoRadialWarp node warps meshes away from a center point. You can use the **Rotation Center** control in the **Properties** to set the location of the warp center or drag the center widget around in the Viewer to set the extent of the warp.

**Tip:** GeoRadialWarp's classic 3D system equivalent is the [RadialDistort](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene you want to affect. |

| Control (UI)  | Knob (Scripting) | Default Value  | Function                                                                                                                                                                                                                                                                                                    |
|---------------|------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GeoRadialWarp |                  |                |                                                                                                                                                                                                                                                                                                             |
| Mask          | mask_patterns    | {lastmodified} | Specifies the mask pattern to match the prim names to affect. The default mask, <b>{lastmodified}</b> , applies the warp to whatever was changed by the previous node. A simple way to think of it is that <b>{lastmodified}</b> affects the node above. You can use standard glob-style variables, such as |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     |                  |               | <p>/*, to create masks or use individual prim names separated by spaces. For example, <b>/GeoCube1 /GeoCard3</b> applies the transform to only those prims.</p> <div>  <b>Tip:</b> You can also use the cog menu, the Viewer picker, or drag and drop paths from the Scene Graph to create masks. </div> |
| Distortion          | distortion       | 0             | Sets the amount of distortion. Values below 0 produce a barrel distortion, whereas values above 0 produce a pin-cushion distortion. If you set the value to 0, the geometry is not distorted.                                                                                                                                                                                             |
| Power Bias          | power_bias       | 4             | Sets the magnitude of the distortion. The higher the value, the more distorted the object becomes.                                                                                                                                                                                                                                                                                        |
| Rotation Center xyz | center           | 0, 0, 0       | <p>Moves the rotation center point of the warp on the xyz axes.</p> <div>  <b>Tip:</b> You can also move the center point by dragging the widget in the Viewer. </div>                                                                                                                                 |
| Scale xyz           | scale            | 1, 1, 1       | Sets the amount of distortion in the x, y, or z directions.                                                                                                                                                                                                                                                                                                                               |
| Preserve Center     | preserve_center  | on            | <p>When enabled, keep the object centered in its original place in 3D space.</p> <p>When disabled, allow the object to be offset from the origin.</p>                                                                                                                                                                                                                                     |

# GeoReference

The GeoReference node creates a new instance of an object, essentially allowing you to duplicate whatever you want. An instance is a light-weight reference to another object, rather than a copy of an object. You can use the **File Path** to reference a file on disk or the **Prim Path** to reference an object in the scene graph.

- **File Path** references an object from an external file and you can give the object a different **Path** so that you can import instances of the same object several times. If you use GeoImport, the **Path** to the object can't be changed, so you would overwrite the object each time you import it.
- **Prim Path** creates an instance of an existing object in the scene and gives it a new **Path**. This is an easy way to create instances of objects in the 3D system. Bear in mind that GeoReference also applies the transforms on the referenced object to the instance, so it appears in the scene in the same place as the original object.

See also [GeoImport](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                          |
|-----------------|-----------------|-------------------------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene you want to reference.            |
|                 | mat             | The file containing the material you want to apply to the object. |

| Control (UI)   | Knob (Scripting)    | Default Value           | Function                                                                                                                                                                                                                                       |
|----------------|---------------------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GeoReference   |                     |                         |                                                                                                                                                                                                                                                |
| Path           | prim_path           | {parent}/<br>{nodename} | The root path of the new object. <b>Path</b> defaults a prim path variable <b>{parent}/{nodename}</b> which is equal to the node name, such as GeoReference1 or GeoReference5.                                                                 |
| Parent Type    | parent_<br>primType | Xform                   | Sets the type of prim to create if there are missing ancestors in the path.                                                                                                                                                                    |
| Reference Type | reference_<br>type  | Reference               | Sets the type of reference to load: <ul style="list-style-type: none"> <li>• <b>Reference</b> - load the object immediately.</li> <li>• <b>Payload</b> - payloads can be delayed to stop heavy geometry loading until you're ready.</li> </ul> |

| Control (UI)   | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|---------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                     |               |  <b>Note:</b> Payloads are loaded by default and the payload icon  at the top of the Scene Graph tab is orange. If you want to defer any object set as payload, click the payload icon  so that it turns gray. |
| Operation      | reference_operation | Prepend Back  | Specifies how the referenced object is ordered in the reference list, which can affect how the object interacts with other objects.                                                                                                                                                                                                                                                                                                                                   |
| File Path      | file_path           | none          | The path to the external file containing the object you're referencing.                                                                                                                                                                                                                                                                                                                                                                                               |
| Prim Path      | ref_prim_path       | none          | The path to the object you want to reference. If you leave this option blank, the target file's default object is used, which is set by the file's author.                                                                                                                                                                                                                                                                                                            |
| Reload         | reload              | N/A           | Click to reload the target file or referenced prim location.                                                                                                                                                                                                                                                                                                                                                                                                          |
| Time Remapping |                     |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Offset         | time_offset         | 0             | Offsets the USD prim animation by this amount                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Scale          | time_scale          | 1             | Scales the referenced prim animation by this amount. Values between 0 and 1 speed up the animation and values higher than 1 slow it down.                                                                                                                                                                                                                                                                                                                             |

# GeoRevolve

The GeoRevolve node creates a cylinder or sphere object in the scene with a prim path variable **{parent}/{nodename}** which is equal to the node name, such as /GeoRevolve1 or /GeoRevolve5. You can change the prim path to update the scene graph as required and set the object's **Kind**, **Purpose**, and **Visibility**.

Nuke only uses **Kinds** with the [GeoDrawMode](#) node, which allows you to display complicated geometry in a simplified form, such as a bounding box or crossed cards, to load scenes faster. It's also good practice to

follow the conventions on the use of **Kind** to create properly-constructed USD stages if you intend to export the scene for use in your pipeline.

The **Purpose** dropdown controls the type of geometry this object represents. The Viewer node's **Properties** > **3D** tab controls which purposes are visible in the 3D Viewer: **Render**, **Proxy**, or **Guide**. The **default** option essentially means 'always render this object', it has no special properties as far as renderers are concerned.

**Visibility** affects whether the object is visible or invisible when you export the scene. The default value is **inherited**, meaning the object's visibility is controlled by its parent object. The **Shape** control determines whether a **Cylinder** or **Sphere** object is created.

**Note:** You can also create GeoSphere and GeoCylinder nodes in the Node Graph, but their node class is always GeoRevolve. Only the node name is changed in the **Properties** panel and scene graph.

You can set the object's appearance using the color and opacity controls and the rows/columns settings determine how many vertices the object is split into. Setting the **Mesh Type** to **shared vertices** and choosing a **Subdivision** option allows you to smooth the object. The level of subdivision can be adjusted using the Viewer node's **Properties** on the **3D** tab under **Refine Level**. The **Refine Level** only affects the Viewer output, not the final rendered scene.

The **Transform** tab allows you to translate, rotate, and scale the object locally, rather than using a dedicated GeoTransform node.

See also [GeoCard](#) and [GeoCube](#).

**Tip:** GeoRevolve's classic 3D system equivalents are the [Cylinder](#) and [Sphere](#) nodes.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                          |
|-----------------|-----------------|-------------------------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene you want to affect.               |
|                 | mat             | The file containing the material you want to apply to the object. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| GeoRevolve   |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Path         | prim_path        | none          | The root path of the new object. <b>Path</b> defaults a prim path variable <b>{parent}/{nodename}</b> which is equal to the node name, such as GeoRevolve1 or GeoRevolve5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Parent Type  | parent_type      | Xform         | <p>Sets the type of prim to create if there are missing ancestors in the path.</p> <div>  <b>Note:</b> Setting the <b>Parent Type</b> to <b>None</b> may cause some referenced objects to behave as if they don't exist. </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Kind         | kind             | group         | <p>Sets the <b>Kind</b> associated with this object. Nuke only uses <b>Kinds</b> with the <a href="#">GeoDrawMode</a> node, which allows you to display complicated geometry in a simplified form, such as a bounding box or crossed cards, to load scenes faster. It's also good practice to follow the conventions on the use of <b>Kind</b> to create properly-constructed USD stages if you intend to export the scene for use in your pipeline. The <b>model</b> option is valid, but should not be used in most cases:</p> <ul style="list-style-type: none"> <li>• <b>model</b> - the root prim in the scene, which is a superclass of group and component.</li> <li>• <b>assembly</b> - used to denote an important group in the scene.</li> <li>• <b>group</b> - a container for other kinds.</li> <li>• <b>component</b> - a leaf kind, which cannot contain other kinds apart from subcomponents.</li> <li>• <b>subcomponent</b> - a special leaf kind for use in components.</li> </ul> |
| Purpose      | purpose          | default       | <p>Sets the object's purpose, which can be used to control how a scene is rendered:</p> <ul style="list-style-type: none"> <li>• <b>default</b> - the object has no particular purpose and is rendered by default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                  |               | <ul style="list-style-type: none"> <li>• <b>render</b> - the object is the full resolution version for use when rendering the scene.</li> <li>• <b>proxy</b> - the object is a proxy version used for test purposes, which can be a lower resolution to decrease render times.</li> <li>• <b>guide</b> - the object is not rendered, but is visible in the Viewer for reference.</li> </ul> <div>  <b>Note:</b> The <b>render</b>, <b>proxy</b>, and <b>guide</b> purposes are only displayed in the 3D Viewer when they are enabled in the Viewer <b>Properties</b> in the <b>3D</b> tab. </div> |
| Visibility      | visibility       | inherited     | <p>Controls whether the object and its descendants are visible in the scene. Making objects invisible can increase scene performance.</p> <ul style="list-style-type: none"> <li>• <b>inherited</b> - the object's visibility is controlled by its parent.</li> <li>• <b>invisible</b> - the object and its descendants are invisible in the scene.</li> </ul>                                                                                                                                                                                                                                                                                                                     |
| Display Color   | display_color    | 1             | Sets the color applied to the faces of the object. You can use the sliders, color picker, or colorwheel to select the required color.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Display Opacity | display_opacity  | 1             | Sets the opacity applied to the faces of the object, where 1 is fully opaque and 0 is fully transparent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Double Sided    | double_sided     | off           | When enabled, the selected color and opacity is applied to both sides of the object's faces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Shape           | shape            | Cylinder      | Determines the shape of the object, <b>Cylinder</b> or <b>Sphere</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                 |
|--------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               |  <b>Note:</b> You can also create GeoSphere and GeoCylinder nodes in the Node Graph, but their node class is always GeoRevolve. Only the node name is changed in the <b>Properties</b> panel and scene graph.                           |
| Rows/Columns | rows             | 30            | Sets the number of rows on each face of the object. The maximum value is 512, but high values may cause instability.                                                                                                                                                                                                     |
|              | columns          | 30            | Sets the number of columns on each face of the object. The maximum value is 512, but high values may cause instability.                                                                                                                                                                                                  |
| Radius       | radius           | 1             | Sets the radius and height of the cylinder or sphere, depending on the <b>Shape</b> you chose.                                                                                                                                                                                                                           |
| Height       | height           | 1             |                                                                                                                                                                                                                                                                                                                          |
| U Extent     | u_extent         | 360           | <p>Sets the extent to which the input image wraps around the object horizontally without extrapolating from the image edges.</p> <p>For example, a value of 180 wraps the input image 90° around the sphere on both sides of the y axis and closes any remainder by extrapolating from the edges of the input image.</p> |
| V Extent     | v_extent         | 180           | <p>Sets the extent to which the input image wraps around the object vertically without extrapolating from the image edges.</p> <p>For example, a value of 90 wraps the input image 45° around the sphere on both sides of the x axis and closes any remainder by extrapolating from the edges of the input image.</p>    |
| Close Top    | close_top        | on            | When on, the top of the object is closed.                                                                                                                                                                                                                                                                                |

The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rotation Order  | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZXY, ZYX.                                                                                                                                                                                                                                                                                                                    |
| Translate       | translate        | 0, 0, 0       | Lets you translate the object along the x, y, and z axes. You can also adjust translate values by clicking and dragging the object in the 3D Viewer.                                                                                                                                                                                                                                                                  |
| Rotate          | rotate           | 0, 0, 0       | Lets you rotate the object around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                   |
| Scale           | scaling          | 1, 1, 1       | Lets you scale the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                    |
| Uniform Scale   | uniform_scale    | 1             | Lets you scale the object simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                     |
| Skew            | skew             | 0, 0, 0       | Lets you skew the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                     |
| Pivot Translate | pivot_translate  | 0, 0, 0       | When you make changes to a 3D object's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot translate and rotate x, y, and z controls allow you to move and rotate the pivot point as required - you can even move it outside of the object. Subsequent transformations applied then occur relative to the new pivot point location and rotation. |
| Pivot Rotate    | pivot_rotate     | 0, 0, 0       | You can hold down <b>Ctrl/Cmd</b> and drag the pivot point to a new location in the 3D Viewer.                                                                                                                                                                                                                                                                                                                        |
| Local Matrix    |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Specify Matrix  | use_matrix       | off           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                           |
| Matrix          | matrix           | N/A           | The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.<br><br>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.                                                                                                                                        |

# GeoScene

The GeoScene node combines two or more objects or stacks of objects into a single output so you can pass the scene to a render node, such as ScanlineRender or RayRender. GeoScene is functionally equivalent to GeoMerge and does not have any node-specific properties.

**Note:** Prims downstream from GeoScene with **Mask** set to **{lastmodified}** inherit from the strongest layer, the layer connected to the highest numbered input.

See also [GeoMerge](#).

**Tip:** GeoScene's classic 3D system equivalent is the [Scene](#) node.

## Inputs and Controls

| Connection Type | Connection Name   | Function                                                       |
|-----------------|-------------------|----------------------------------------------------------------|
| Input           | [numbered inputs] | Combines any new 3D system objects you want to merge together. |

# GeoScope

The GeoScope node creates a single Scope object, which can be used for grouping objects together to organize the scene graph.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                          |
|-----------------|-----------------|-------------------------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene you want to affect.               |
|                 | mat             | The file containing the material you want to apply to the object. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GeoScope     |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Path         | prim_path        | none          | The root path of the new object. <b>Path</b> defaults a prim path variable <b>{parent}/{nodename}</b> which is equal to the node name, such as GeoScope1 or GeoScope5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Parent Type  | parent_type      | Xform         | <p>Sets the type of prim to create if there are missing ancestors in the path.</p> <div>  <b>Note:</b> Setting the <b>Parent Type</b> to <b>None</b> may cause some referenced objects to behave as if they don't exist. </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Kind         | kind             | group         | <p>Sets the <b>Kind</b> associated with this object. Nuke only uses <b>Kinds</b> with the <b>GeoDrawMode</b> node, which allows you to display complicated geometry in a simplified form, such as a bounding box or crossed cards, to load scenes faster. It's also good practice to follow the conventions on the use of <b>Kind</b> to create properly-constructed USD stages if you intend to export the scene for use in your pipeline. The <b>model</b> option is valid, but should not be used in most cases:</p> <ul style="list-style-type: none"> <li>• <b>model</b> - the root prim in the scene, which is a superclass of group and component.</li> <li>• <b>assembly</b> - used to denote an important group in the scene.</li> <li>• <b>group</b> - a container for other kinds.</li> <li>• <b>component</b> - a leaf kind, which cannot contain other kinds</li> </ul> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Purpose      | purpose          | default       | <p>Sets the object's purpose, which can be used to control how a scene is rendered:</p> <ul style="list-style-type: none"> <li>• <b>default</b> - the object has no particular purpose and is rendered by default.</li> <li>• <b>render</b> - the object is the full resolution version for use when rendering the scene.</li> <li>• <b>proxy</b> - the object is a proxy version used for test purposes, which can be a lower resolution to decrease render times.</li> <li>• <b>guide</b> - the object is not rendered, but is visible in the Viewer for reference.</li> </ul> <div>  <b>Note:</b> The <b>render</b>, <b>proxy</b>, and <b>guide</b> purposes are only displayed in the 3D Viewer when they are enabled in the Viewer <b>Properties</b> in the <b>3D</b> tab. </div> |
| Visibility   | visibility       | inherited     | <p>Controls whether the object and its descendants are visible in the scene. Making objects invisible can increase scene performance.</p> <ul style="list-style-type: none"> <li>• <b>inherited</b> - the object's visibility is controlled by its parent.</li> <li>• <b>invisible</b> - the object and its descendants are invisible in the scene.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

# GeoScript

The GeoScript node allows you to add a layer to the scene by typing USD code into the text editor manually.

**Tip:** If you want to view the previous USD stage in text form, use the [GeoViewScene](#) node.

For example, to add a layer containing simple, transformable cube geometry with a size of 4 units:

USD Source

```
1 | #usda 1.0
2 |
3 | def Xform "Cube"
4 |   {
5 |     def Cube "box" {
6 |       double size = 4.0
7 |     }
8 |   }
```

Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene you want to affect. |

| Control (UI) | Knob (Scripting) | Default Value      | Function                                                                                                            |
|--------------|------------------|--------------------|---------------------------------------------------------------------------------------------------------------------|
| GeoScript    |                  |                    |                                                                                                                     |
| Source       | usd_source       | dependent on stage | Displays the USD stage in text form and allows you to add a layer by typing USD code into the text editor manually. |
| Reload       | reload           | N/A                | Click to reload the source panel if the stage has changed.                                                          |

GeoSelector

The GeoSelector node allows you to store a face or vertex selection in the Viewer and then reapply the selection to another object. Each selection is stored using the prim's scene graph location, so you can store as many selections as required as long as each selection has a unique path. For example, an 8x8 card with its top row of faces selected and another 8x8 card with all faces selected:

```
{ /GeoCard1/Card faces 8 1 56 0 facWei 8 1 56 0 }
{ /GeoCard2/Card faces 64 1 facWei 64 1 }
```

**Tip:** GeoSelector's classic 3D system equivalent is the [GeoSelect](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene you want to affect. |

| Control (UI)      | Knob (Scripting)  | Default Value  | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|-------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GeoSelector       |                   |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Mask              | mask_patterns     | {lastmodified} | <p>Specifies the mask pattern to match the prim names to affect. The default mask, <b>{lastmodified}</b>, saves a selection from whatever was changed by the previous node. A simple way to think of it is that <b>{lastmodified}</b> affects the node above. You can use standard glob-style variables, such as <b>/*</b>, to create masks or use individual prim names separated by spaces. For example, <b>/GeoCube1 /GeoCard3</b> applies the transform to only those prims.</p> <div>  <p><b>Tip:</b> You can also use the cog menu, the Viewer picker, or drag and drop paths from the Scene Graph to create masks.</p> </div> |
| Save Selection    | save_selection    | N/A            | Click to save the currently selected faces or vertices, dependent on the 3D Viewer mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Restore Selection | restore_selection | N/A            | Click to restore the selected faces or vertices saved in the node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## GeoTransform

The GeoTransform node applies transforms to objects in a 3D scene, including translate, rotate, scale, and skew. The **Mask** property controls the objects that are affected by the node, which allows you to transform the entire scene or only certain objects. The default mask, **{lastmodified}**, applies the transform to whatever was changed by the previous node. A simple way to think of it is that **{lastmodified}** affects the node above, which is just the GeoRevolve node in the video example. You can enter as many object paths as required, such as `/GeoCube1` and `/GeoRevolve1`, and then adjust the transform controls to affect just those objects. You can also use simple expressions, such as `/GeoC*` to affect anything with a path beginning "GeoC" or `/*` (forwardslash asterisk) to affect everything in the scene.

In larger scenes you can use the Scene Graph or eye dropper in the **Properties** panel to select objects to transform. To use the Scene Graph, navigate to the object you want to transform and drag the path into the GeoTransform **Mask** control. You can drag as many individual objects as you like into the **Mask** control as long as each path is separated by a space or you can multi-select objects and drag them into the **Mask** control all at once.

To use the eye dropper, click the  dropper icon in the **Properties** panel and then click the required object in the 3D Viewer to add it to the **Mask** control. To make multiple selections, hold **Ctrl/Cmd+Shift** and click the required objects in the 3D Viewer.

GeoTransform also includes two optional inputs, **look** and **axis**, to control transforms automatically:

- If the **look** input is connected, the transformed 3D object is automatically rotated to point towards the **look** object, even if it is moved. You can change the axis on which the object rotates to look at the camera on the **Look** tab.
- If the **axis** input is connected, the transform controls on the Axis node override the corresponding controls on the GeoTransform node.

**Tip:** GeoTransform's classic 3D system equivalent is the [TransformGeo](#) node.

# Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                      |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene you want to translate, rotate, scale, or skew. The <b>Mask</b> control determines which objects in the scene are affected, by default <b>{lastmodified}</b> . |
|                 | look            | An optional input where you can connect a 3D object that the                                                                                                                                  |

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                 | <p>transformed 3D object should face. If a <b>look</b> input exists, the transformed 3D object is automatically rotated to point towards the <b>look</b> input whenever the <b>look</b> input is moved.</p> <p>This can be useful, for example, if you have a 2D matte painting mapped to a Card in your scene. The <b>look</b> input ensures that the plane of the painting always faces the camera, regardless of the camera position, and maintains the illusion depicted by the painting.</p> |
|                 | axis            | <p>An optional Axis node input. This links the position, rotation, scale, and skew of the transformed 3D object(s) to the Axis node, so that the transformation controls on the Axis node override the corresponding controls on the GeoTransform node.</p> <p>If you've worked with other 3D applications, you may know the Axis node as a "null" or "locator" object.</p>                                                                                                                       |

| Control (UI)     | Knob (Scripting) | Default Value  | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|  | file_menu        | N/A           | <p>Select to import or export a channel file:</p> <ul style="list-style-type: none"> <li>• <b>Import chan file</b> - import a channel file and transform the input object according to the transformation data in the channel file. Channel files contain a set of Cartesian coordinates for every frame of animation in a given shot. You can create and export them using Nuke or 3D tracking software, such as 3D-Equalizer, Maya, or Boujou.</li> <li>• <b>Export chan file</b> - export the translation parameters that you've applied to the input object as a channel file. This is a useful method of sharing setups between artists.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                           |
|  | snap_menu        | N/A           | <p>Choose what a selection in the Viewer or pivot point is snapped to in the Viewer:</p> <ul style="list-style-type: none"> <li>• <b>Geo to Selection (position)</b> - the object is snapped to a new position depending on the points selected.</li> <li>• <b>Geo to Selection (position, orientation)</b> - the object is snapped to a new position and orientation depending on the points selected.</li> <li>• <b>Geo to Selection (position, orientation, size)</b> - the object is snapped to a new position, orientation, and size depending on the points selected.</li> <li>• <b>Pivot Point to Selection (position)</b> - the pivot point is snapped to a new position depending on the points selected.</li> <li>• <b>Pivot Point to Selection (position, orientation)</b> - the pivot point is snapped to a new position and orientation depending on the points selected.</li> <li>• <b>Pivot Point to Selection (orientation)</b> - the pivot point is snapped to a new position, orientation, and size depending on the points selected.</li> </ul> |
| Transform Order                                                                   | xform_order      | SRT           | <p>Sets the operation order for scale (S), rotation (R), and translation (T). The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                               |
|-----------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rotation Order  | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZXY, ZYX.                                                                                                                                     |
| Translate       | translate        | 0,0,0         | Translates the selection along the x, y, and z axes. You can also adjust translate values by clicking and dragging the axis in the 3D Viewer.                                                                                          |
| Rotate          | rotate           | 0,0,0         | Rotates the selection around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                         |
| Scale           | scaling          | 1,1,1         | Scales the selection on the x, y, and z axes.                                                                                                                                                                                          |
| Uniform Scale   | uniform_scale    | 1             | Scales the selection simultaneously on the x, y, and z axes.                                                                                                                                                                           |
| skew            | skew             | 0,0,0         | Skews the selection on the x, y, and z axes.                                                                                                                                                                                           |
| Pivot Translate | pivot_translate  | 0,0,0         | Translates the pivot point and transform handles along the x, y, and z axes without affecting the objects in the scene. You can also translate the pivot point by holding down <b>Ctrl/Cmd</b> and dragging the axis in the 3D Viewer. |
| Pivot Rotate    | pivot_rotate     | 0,0,0         | Rotates the pivot point and transform handles along the x, y, and z axes without affecting the objects in the scene. You can also rotate the pivot point by holding down <b>Ctrl/Cmd</b> and dragging the axis in the 3D Viewer.       |
| Local Matrix    |                  |               |                                                                                                                                                                                                                                        |
| Specify Matrix  | useMatrix        | off           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                            |
| matrix          | matrix           | N/A           | <p>The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>Specify Matrix</b> and copy or drag-and-drop matrix values from another object to apply those</p>                  |

| Control (UI)                                                                              | Knob (Scripting)     | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------------------------------------------------|----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                           |                      |               | values, for example, if you wanted to align objects in a scene.                                                                                                                                                                                                                                                                                                                           |
| Prim Transform Order                                                                      | xform_op_order       | Prepend       | <p>Determines when transforms should be applied to the objects specified in the <b>Mask</b> control:</p> <ul style="list-style-type: none"> <li>• <b>Prepend</b> - applies the transforms from this node before any other transforms applied to the object.</li> <li>• <b>Append</b> - applies the transforms from this node after any other transforms applied to the object.</li> </ul> |
| Look Tab - controls on this tab are only enabled when the <b>look</b> input is connected. |                      |               |                                                                                                                                                                                                                                                                                                                                                                                           |
| Look Axis                                                                                 | look_axis            | +Z            | Defines the axis around which the 3D object is rotated to face the <b>look</b> input.                                                                                                                                                                                                                                                                                                     |
| Rotate X                                                                                  | look_rotate_x        | on            | Determines whether the rotation occurs around the X axis. Note that for the rotation to truly "look at" the <b>look</b> input, all three of these options must be activated.                                                                                                                                                                                                              |
| Rotate Y                                                                                  | look_rotate_y        | on            | Determines whether the rotation occurs around the Y axis. Note that for the rotation to truly "look at" the <b>look</b> input, you have to set all three of these options.                                                                                                                                                                                                                |
| Rotate Z                                                                                  | look_rotate_z        | on            | Determines whether the rotation occurs around the Z axis. Note that for the rotation to truly "look at" the <b>look</b> input, you have to set all three of these options.                                                                                                                                                                                                                |
| Look Strength                                                                             | look_strength        | 1             | Determines to what extent the 3D object rotates to the new orientation. The smaller the value, the less the object is rotated. Setting the value to 0 produces no rotation.                                                                                                                                                                                                               |
| Use Quaternions                                                                           | look_use_quaternions | off           | Uses an alternate scheme to calculate the <b>look</b> rotation. This option may be useful to smooth out erratic rotations along the look axis.                                                                                                                                                                                                                                            |

# GeoTrilinearWarp

The GeoTrilinearWarp node warps meshes by moving the corners of its bounding box separately to create the warp.

**Tip:** GeoTrilinearWarp's classic 3D system equivalent is the [Trilinear](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene you want to affect. |

| Control (UI)         | Knob (Scripting) | Default Value  | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------|------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GeoTrilinearWarp     |                  |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Mask                 | mask_patterns    | {lastmodified} | Specifies the mask pattern to match the prim names to affect. The default mask, <b>{lastmodified}</b> , applies the warp to whatever was changed by the previous node. A simple way to think of it is that <b>{lastmodified}</b> affects the node above. You can use standard glob-style variables, such as <b>/*</b> , to create masks or use individual prim names separated by spaces. For example, <b>/GeoCube1 /GeoCard3</b> applies the transform to only those prims. <div>  <b>Tip:</b> You can also use the cog menu, the Viewer picker, or drag and drop paths from the Scene Graph to create masks. </div> |
| Reset Shape To Input | reset_shape      | N/A            | Cancels your changes and resets the input to its original shape.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Copy                 | copy_shape       | N/A            | Copies the current positions of the bounding box corners ( <b>p0-p7</b> ) into a temporary buffer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Control (UI) | Knob (Scripting) | Default Value    | Function                                                                                                                                                                                              |
|--------------|------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Paste        | paste_shape      | N/A              | Pastes previously copied positions of the bounding box corners ( <b>p0-p7</b> ).                                                                                                                      |
| Set Key      | set_key_shape    | N/A              | Sets keys for the positions of all the bounding box corners ( <b>p0-p7</b> ) on the current frame. This is the same as selecting <b>Set key</b> from the animation menu next to each of the controls. |
| Delete Key   | delete_key_shape | N/A              | Deletes the keys on the positions of all the bounding box corners ( <b>p0-p7</b> ) on the current frame.                                                                                              |
| Delete Anim  | del_anim_shape   | N/A              | Deletes the keys on the positions of all the bounding box corners ( <b>p0-p7</b> ) on all frames.                                                                                                     |
| P0 xyz       | p0               | -0.5, -0.5, -0.5 | Sets the x, y, and z coordinates for the <b>p0</b> corner of the bounding box. You can also adjust these by dragging the corresponding vertex in the Viewer.                                          |
| P1 xyz       | p1               | -0.5, 0.5, -0.5  | Sets the x, y, and z coordinates for the <b>p1</b> corner of the bounding box. You can also adjust these by dragging the corresponding vertex in the Viewer.                                          |
| P2 xyz       | p2               | 0.5, 0.5, 0.5    | Sets the x, y, and z coordinates for the <b>p2</b> corner of the bounding box. You can also adjust these by dragging the corresponding vertex in the Viewer.                                          |
| P3 xyz       | p3               | 0.5, -0.5, -0.5  | Sets the x, y, and z coordinates for the <b>p3</b> corner of the bounding box. You can also adjust these by dragging the corresponding vertex in the Viewer.                                          |
| P4 xyz       | p4               | -0.5, -0.5, 0.5  | Sets the x, y, and z coordinates for the <b>p4</b> corner of the bounding box. You can also adjust these by dragging the corresponding vertex in the Viewer.                                          |
| P5 xyz       | p5               | -0.5, 0.5, 0.5   | Sets the x, y, and z coordinates for the <b>p5</b> corner of the bounding box. You can also adjust these by dragging the corresponding vertex in the Viewer.                                          |
| P6 xyz       | p6               | 0.5, 0.5, 0.5    | Sets the x, y, and z coordinates for the <b>p6</b> corner of the bounding box. You can also adjust these by dragging the corresponding vertex in the Viewer.                                          |

| Control (UI)              | Knob (Scripting) | Default Value    | Function                                                                                                                                                                       |
|---------------------------|------------------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| P7 xyz                    | p7               | 0.5, -0.5, 0.5   | Sets the x, y, and z coordinates for the <b>p7</b> corner of the bounding box. You can also adjust these by dragging the corresponding vertex in the Viewer.                   |
| Source Box Tab            |                  |                  |                                                                                                                                                                                |
| Use Incoming Bounding Box | src_use_bbox     | on               | By default, the node warps the bounding box of the input object. If you'd rather warp a custom bounding box, uncheck this and use the controls below to define the custom box. |
| Reset Source Box To Input | reset_src_shape  | N/A              | When <b>Use Incoming Bounding Box</b> is disabled, cancels any changes you've made to the custom bounding box and resets it to the original settings taken from the input.     |
| Box                       | src_color        | red              | When <b>Use Incoming Bounding Box</b> is disabled, sets the color of the custom bounding box in the 3D Viewer.                                                                 |
| Source 0 xyz              | src0             | -0.5, -0.5, -0.5 | When <b>Use Incoming Bounding Box</b> is disabled, sets the x, y, and z coordinates for one of the two custom bounding box corners you can adjust.                             |
| Source 1 xyz              | src1             | 0.5, 0.5, 0.5    | When <b>Use Incoming Bounding Box</b> is disabled, sets the x, y, and z coordinates for one of the two custom bounding box corners you can adjust.                             |

# GeoUVProject

The GeoUVProject node modifies or creates texture coordinates on a mesh using a projection from a Camera or an Axis node. If the object already has UV coordinates, this node replaces them. This simple example shows a CheckerBoard material projected onto a bunny using a Camera node to position the material.

**Tip:** GeoUVProject's classic 3D system equivalent is the [UVProject](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                       |
|-----------------|-----------------|----------------------------------------------------------------|
| Input           | axis/cam        | The Axis or Camera node controlling the projection attributes. |
|                 | unnamed         | The previous stage in the scene you want to affect.            |

| Control (UI) | Knob (Scripting) | Default Value  | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GeoUVProject |                  |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Mask         | mask_patterns    | {lastmodified} | <p>Specifies the mask pattern to match the prim names to affect. The default mask, <b>{lastmodified}</b>, applies the effect to whatever was changed by the previous node. A simple way to think of it is that <b>{lastmodified}</b> affects the node above. You can use standard glob-style variables, such as <b>/*</b>, to create masks or use individual prim names separated by spaces. For example, <b>/GeoCube 1 /GeoCard3</b> applies the effect to only those prims.</p> <div>  <b>Tip:</b> You can also use the cog menu, the Viewer picker, or drag and drop paths from the Scene Graph to create masks. </div> |
| Projection   | projection       | Perspective    | <p>Sets the projection type for rendered objects. Usually, it's best to select a type that's close to the object's surface shape.</p> <ul style="list-style-type: none"> <li>• Off</li> <li>• Perspective</li> <li>• Planar</li> <li>• Spherical</li> <li>• Cylindrical</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                      |                  |               |  <b>Note:</b> When <b>Projection</b> is set to <b>off</b> , the GeoUVProject node is essentially disabled.                                                                                                                                                                |
| Plane                | plane            | XY            | <p>Sets the projection direction to project the texture image along axes:</p> <ul style="list-style-type: none"> <li>• XY</li> <li>• YZ</li> <li>• ZX</li> </ul>  <b>Note:</b> This dropdown menu is only available if you selected <b>planar</b> as the projection type. |
| Project On           | project_on       | Both          | <p>Sets which surfaces of a 3D object the projection falls on through the camera:</p> <ul style="list-style-type: none"> <li>• Both</li> <li>• Front</li> <li>• Back</li> </ul>                                                                                                                                                                            |
| View Frustum Culling | frustum_culling  | off           | When enabled, the GeoUVProject node affects only the vertices inside the camera view frustum. Any vertices outside the view frustum are not affected and they retain their original uv coordinates.                                                                                                                                                        |
| Invert U             | u_invert         | off           | When enabled, the u coordinates are inverted on the horizontal axis.                                                                                                                                                                                                                                                                                       |
| Invert V             | v_invert         | off           | When enabled, the v coordinates are inverted on the vertical axis.                                                                                                                                                                                                                                                                                         |
| U Scale              | u_scale          | 1             | Stretches or squashes the texture on the horizontal axis.                                                                                                                                                                                                                                                                                                  |
| V Scale              | v_scale          | 1             | Stretches or squashes the texture on the vertical axis.                                                                                                                                                                                                                                                                                                    |
| Attribute Name       | uv_attrib_name   | primvars:st   | Specifies the name of the attribute to use for the UV coordinates of the upstream geometry. If your geometry has more than one set of UV coordinates, you can choose the attribute that suits the projection type.                                                                                                                                         |

| Control (UI)         | Knob (Scripting)     | Default Value | Function                                                                                                                                                                                                                                                                                            |
|----------------------|----------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Generate Perspective | generate_w           | off           | When enabled, GeoUVProject generates an <b>stw</b> attribute that adds a perspective component <b>w</b> to the UV coordinates.                                                                                                                                                                      |
| W Attribute Name     | uvw_attrib_name      | primvars:stw  | When <b>Generate Perspective</b> is enabled, <b>W Attribute Name</b> specifies the name of the attribute to use for the perspective UV coordinates of the upstream geometry. If your geometry has more than one set of UV coordinates, you can choose the attribute that suits the projection type. |
| Reference Frame      |                      |               |                                                                                                                                                                                                                                                                                                     |
| Use Reference Frame  | use_reference_frame  |               | If on the projection will be applied at the reference frame only.                                                                                                                                                                                                                                   |
| Reference Frame      | reference_frame      |               | The reference frame for the projection. The projection is performed at this frame and the UVs will be used for all other frames. This allows a projection to be stuck to a changing geometry.                                                                                                       |
| Animation Menu       | animation_menu       |               | Allows you to view animation keys and modify them.                                                                                                                                                                                                                                                  |
| Set to Current Frame | set_to_current_frame |               | Set the reference frame to the current frame.                                                                                                                                                                                                                                                       |

# GeoViewScene

The GeoViewScene node displays the USD stage passing through the node in read-only text form. GeoViewScene is primarily used for debugging layers imported from other applications, such as Houdini or Maya. If something doesn't look right in the Viewer, you can compare the source code between apps to check there were no errors during import.

**Tip:** If you want to add a USD layer manually use the [GeoScript](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                          |
|-----------------|-----------------|---------------------------------------------------|
| Input           | unnamed         | The previous stage in the scene you want to view. |

| Control (UI)   | Knob (Scripting) | Default Value      | Function                                                        |
|----------------|------------------|--------------------|-----------------------------------------------------------------|
| GeoViewScene   |                  |                    |                                                                 |
| Refresh        | refresh          | N/A                | Click to refresh the source panel if the stage has changed.     |
| Maximum Length | max_length       | 500                | Sets the maximum number of lines displayed in the source panel. |
| Source         | usd_source       | dependent on stage | Displays the USD stage in text form.                            |

# MergeLayer

The MergeLayer node combines two input shaders to produce a composite of the two. The default merge operation is A **over** B, but several other **Operations** are available, such as **stencil** and **mask**.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                           |
|-----------------|-----------------|------------------------------------------------------------------------------------|
| Input           | A               | The two shaders you want to merge. The default merge operation is A <b>over</b> B. |
|                 | B               |                                                                                    |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Also Merge     | also_merge       | none          | Sets the shader channels that are merged in addition to those specified in the <b>channels</b> control.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Operation      | operation        | over          | <p>Sets the merge operation to use:</p> <ul style="list-style-type: none"> <li>• <b>none</b> - No merge is calculated, only shader <b>B</b> affects the output.</li> <li>• <b>replace</b> - Replaces shader <b>B</b> with shader <b>A</b>.</li> <li>• <b>over</b> - This is the default operation. Layers shader <b>A</b> over <b>B</b> according to the alpha of shader <b>A</b>. Algorithm: <b>A+B(1-a)</b></li> <li>• <b>stencil</b> - Only shows the areas of shader <b>B</b> that do not overlap with the alpha of <b>A</b>. Algorithm: <b>B(1-a)</b></li> <li>• <b>mask</b> - Only shows the areas of shader <b>B</b> that overlap with the alpha of <b>A</b>. Algorithm: <b>Ba</b></li> <li>• <b>plus</b> - The sum of image <b>A</b> and <b>B</b>. Note that <b>plus</b> may result in pixel values higher than 1.0. Algorithm: <b>A+B</b></li> <li>• <b>max</b> - Takes the maximum values of both shaders. Algorithm: <b>max(A,B)</b></li> <li>• <b>min</b> - Takes the minimum values of both images. Algorithm: <b>min(A,B)</b></li> </ul> |

# PointLight

A PointLight is a point in 3D space that emits light radially in every direction. Real world examples of point lights are light bulbs, lamps, and candles, which can be simulated using PointLights.

See also [DirectLight](#), [EnvironmentLight](#), and [SpotLight](#).

**Tip:** PointLight's classic 3D system equivalent is the [Point](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                  |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | look            | An optional input to force the light to "look" at an Axis node.                                                                                                                                                           |
|                 | axis            | An optional input to link the position, rotation, scale, and skew of the transformed 3D object(s) to an Axis node, so that the transformation controls on the Axis node override the corresponding controls on this node. |

**Tip:** If you've worked with other 3D applications, you may know the Axis node as a "null" or "locator" object.

| Control (UI)             | Knob (Scripting)         | Default Value | Function                                                                                                                                             |

The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Rotation Order                                                                    | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZXY, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Translate       | translate        | 0, 0, 0       | Lets you translate the object along the x, y, and z axes. You can also adjust translate values by clicking and dragging the object in the 3D Viewer.                                                                                                                                                                                                                                                                  |
| Rotate          | rotate           | 0, 0, 0       | Lets you rotate the object around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                   |
| Scale           | scaling          | 1, 1, 1       | Lets you scale the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                    |
| Uniform Scale   | uniform_scale    | 1             | Lets you scale the object simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                     |
| Skew            | skew             | 0, 0, 0       | Lets you skew the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                     |
| Pivot Translate | pivot_translate  | 0, 0, 0       | When you make changes to a 3D object's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot translate and rotate x, y, and z controls allow you to move and rotate the pivot point as required - you can even move it outside of the object. Subsequent transformations applied then occur relative to the new pivot point location and rotation. |
| Pivot Rotate    | pivot_rotate     | 0, 0, 0       | You can hold down <b>Ctrl/Cmd</b> and drag the pivot point to a new location in the 3D Viewer.                                                                                                                                                                                                                                                                                                                        |
| Local Matrix    |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Specify Matrix  | useMatrix        | N/A           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                           |
| Matrix          | matrix           | N/A           | The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.<br><br>Check <b>Specify Matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for                                                                                                                                                                                            |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|              |                  |               | example, if you wanted to align objects in a scene.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| World Matrix |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| World matrix | world_matrix     | N/A           | Displays the world or absolute xyz transform of the node in world coordinates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|              |                  |               | <div>  <b>Note:</b> Unlike the <b>Local matrix</b>, you can't adjust the <b>World matrix</b> manually. </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Shadows Tab  |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| cast shadows | cast_shadows     | disabled      | When enabled, the light casts shadow as defined by the <b>Shadow</b> controls. However, casting shadows from a Point light type is not currently supported in the ScanlineRender node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| shadow mode  | shadow_mode      | solid         | <p>Presents three shadow casting modes that affect shadows cast by objects, based on the objects' opacity:</p> <ul style="list-style-type: none"> <li>• <b>solid</b> - objects that cast shadows are considered to be completely solid. This option can be used with both ScanlineRender and PrmanRender.</li> <li>• <b>clipped alpha</b> - objects that cast shadows are considered to be transparent if the object's alpha is below the light's clipping threshold control in the Shadows tab. This option is only relevant if you are using ScanlineRender to render your shadows.</li> <li>• <b>full alpha</b> - shadows are calculated based on how light is reduced when it passes through non-opaque occluders. This option is only relevant if you are using ScanlineRender to render your shadows.</li> </ul> |
| filter       | filter           | cubic         | Determines the type of filter that the <b>shadow mode</b> uses when it's set to <b>clipped alpha</b> or <b>full alpha</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Control (UI)  | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|---------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| scene epsilon | scene_epsilon       | 0.001         | <p>An offset that moves the sampling point away from the geometry surface, towards the light that is casting the shadow. Increasing this value can reduce self-shadowing artifacts.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>full alpha</b>.</p>                                                                                                      |
| samples       | samples             | 1             | <p>Sets the number of samples for the light when generating soft shadows. If soft shadows in your scene appear dotty or noisy, try increasing this value. The higher the value, the smoother the soft the shadows become.</p> <p>This control is only relevant when <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p>                                                                                              |
| sample width  | sample_width        | 1             | <p>Sets the size of the light for soft shadows. This value determines the width of the soft area around the edge of a shadow. The higher the value, the larger the soft area.</p> <p>This control is only relevant if your shadows are generated using raytracing.</p>                                                                                                                                                                  |
| bias          | depthmap_bias       | 0.01          | <p>Sets the bias for the raytracing or shadow map. Increase this value if self shadowing artifacts appear in the image. This moves the surface sample point away from surface. Note, however, that if you increase the value too much, some shadows may start moving away from the base of the objects that cast them.</p> <p>This control is only relevant when <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p> |
| slope bias    | depthmap_slope_bias | 0.01          | <p>Bias for the shadow map. This is like <b>bias</b>, but the offset is proportional to the slope of the depth map. This allows you to give a different offset to each value in the depth map, depending on the surface's slope relative to the</p>                                                                                                                                                                                     |

| Control (UI)        | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|---------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     |                     |               | <p>light.</p> <p>If increasing <b>bias</b> reduced the existing self-shadowing artifacts but introduced more artifacts in other areas of the image, you may want to bring <b>bias</b> down a little and increase <b>slope bias</b> instead.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p>                                                                                                                                                                                     |
| clipping threshold  | clipping_threshold  | 0.5           | <p>Objects that are set to cast shadows are considered transparent if their alpha is below the value set here.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>clipped alpha</b>.</p>                                                                                                                                                                                                                                                                                                                                  |
| jitter scale        | shadow_jitter_scale | 3             | <p>Sets the amount of jitter used when doing percentage-closer filtering (PCF) for soft shadows. A larger <b>jitter scale</b> value results in softer, more perceptually accurate shadows.</p> <p>PCF works by sampling the depth map at many different positions around the same spot. The final shadow value for that spot is an average of how many of the samples were occluded or visible from point of view of the light.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p> |
| depthmap resolution | depthmap_width      | 1024          | <p>Sets the resolution of the depth map. Larger values will result in a less crunchy edge, but will require more time to process.</p> <p>Note that you can also fix crunchy edges by increasing the number of <b>samples</b> instead of increasing the depth map resolution.</p>                                                                                                                                                                                                                                                                                                                  |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                |
|--------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b> . |
| output mask  | shadow_mask      | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                |
|              |                  | none          | Sets the channel you want to output the shadow map into. This can be enabled even if the <b>cast shadows</b> box is disabled.                           |

# PointsGenerator

Using the PointsGenerator node (NukeX only) you can create a dense point cloud based on the information generated by [CameraTracker](#) and use the dense point cloud further to create 3D meshes of your 2D footage. Dense point clouds are a useful starting point for 3D modeling and positioning objects in a scene.

**Note:** The analysis must be performed in NukeX, but the result can be used in Nuke.

**Tip:** PointsGenerator's classic 3D system equivalent is the [PointCloudGenerator](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                               |
|-----------------|-----------------|----------------------------------------------------------------------------------------|
| Input           | Camera          | The camera track of the scene from which you intend to generate the dense point cloud. |

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | Mask            | <p>An optional image to use as a mask. By default, the point cloud is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>Mask</b> control is disabled or set to <b>None</b>.</p> |
|                 | Source          | The source footage from which the camera information was obtained.                                                                                                                                                                                                                                                                                                           |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PointsGenerator Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Path                | prim_path        | none          | The root path of the new object. <b>Path</b> defaults a prim path variable <b>{parent}/{nodename}</b> which is equal to the node name, such as PointsGenerator1 or PointsGenerator5.                                                                                                                                                                                                                                                                                                                                                  |
| Parent Type         | parent_prim_type | Xform         | <p>Sets the type of prim to create if there are missing ancestors in the path.</p> <div>  <b>Note:</b> Setting the <b>Parent Type</b> to <b>None</b> may cause some referenced objects to behave as if they don't exist. </div>                                                                                                                                                                                                                    |
| Ignore Mask         | ignore           | None          | <p>Set the mask type to exclude areas of the sequence during generation:</p> <ul style="list-style-type: none"> <li>• <b>None</b> - none of the footage is ignored.</li> <li>• <b>Source Alpha</b> - use the alpha channel of the source clip to define which areas to ignore.</li> <li>• <b>Source Inverted Alpha</b> - use the inverted alpha channel of the source clip to define which areas to ignore.</li> <li>• <b>Mask Luminance</b> - use the luminance of the <b>Mask</b> input to define which areas to ignore.</li> </ul> |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  |                  |               | <ul style="list-style-type: none"> <li>• <b>Mask Inverted Luminance</b> - use the inverted luminance of the <b>Mask</b> input to define which areas to ignore.</li> <li>• <b>Mask Alpha</b> - use the <b>Mask</b> input alpha channel to define which areas to ignore.</li> <li>• <b>Mask Inverted Alpha</b> - use the inverted <b>Mask</b> input alpha channel to define which areas to ignore.</li> </ul> |
| Set Keyframes    |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                             |
| Analyze Sequence | analyzeSequence  | N/A           | <p>Click to automatically analyze the sequence and set the required keyframes to use when generating the point cloud.</p> <div>  <b>Note:</b> Keyframes are selected to provide a large enough camera baseline to triangulate points, but you can add and delete keyframes manually, if necessary. </div>                  |
| Keyframes        | keyframes        | 0             | Displays the frames used to track points in the input sequence. Both automatic and manual keyframes are shown.                                                                                                                                                                                                                                                                                              |
| Add              | addKeyframe      | N/A           | Click to set a keyframe at the current frame.                                                                                                                                                                                                                                                                                                                                                               |
| Delete           | deleteKeyframe   | N/A           | Click to delete the keyframe at the current frame.                                                                                                                                                                                                                                                                                                                                                          |
| Frame Spacing    | frameSpacing     | 15            | Sets the interval between keyframes when you click <b>Add All</b> . For example, the default value creates a keyframe every 15th frame.                                                                                                                                                                                                                                                                     |
| Add All          | addAllKeyframes  | N/A           | Click to set keyframes throughout the sequence at intervals specified by the <b>Frame Spacing</b> control. For example, for a sequence with 30 frames, the default spacing value creates 3 keyframes.                                                                                                                                                                                                       |
| Delete All       | deleteKeyframes  | N/A           | Click to delete all keyframes in the sequence.                                                                                                                                                                                                                                                                                                                                                              |
| Calculated       | accuracy         | 0             | Displays the depth accuracy calculated at the current                                                                                                                                                                                                                                                                                                                                                       |

| Control (UI)            | Knob (Scripting)      | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|-----------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accuracy                |                       |               | <p>frame when using the automatic <b>Set Keyframes</b> method.</p> <p>The accuracy rating can help you to select frame ranges when generating a point cloud - higher accuracy frames produce cleaner point clouds.</p>                                                                                                                                                    |
| Dense Tracking          |                       |               |                                                                                                                                                                                                                                                                                                                                                                           |
| Point Separation        | pointSeparation       | 2             | Sets the separation value, in pixels, for points in the dense point cloud. Reduce the separation to create denser point clouds and vice-versa.                                                                                                                                                                                                                            |
| Track Threshold         | matchThreshold        | 0.5           | Sets the correlation threshold at which point tracks are terminated. Use a higher threshold to increase the accuracy in matching points between keyframes.                                                                                                                                                                                                                |
| Track Points            | track                 | N/A           | <p>Click to display a frame range dialog to determine which frames are used to calculate the point cloud. Use the standard Nuke notation, for example, 1-19, 40-60, 65-100.</p> <p>Points can also be added to the point cloud in stages using different frame range selections. Use <b>Calculated Accuracy</b> to determine the most accurate frames for generation.</p> |
| Clear Points            | clearPoints           | N/A           | Click to clear all tracked points.                                                                                                                                                                                                                                                                                                                                        |
| Post Filtering          |                       |               |                                                                                                                                                                                                                                                                                                                                                                           |
| Display rejected points | displayRejectedPoints | enabled       | <p>When enabled, points that fall outside the <b>Angle</b> and <b>Density Thresholds</b> are highlighted in the 3D Viewer.</p> <p>When disabled, all rejected points are removed from the Viewer.</p>                                                                                                                                                                     |
| Angle Threshold         | minTriAngle           | 1             | Sets the threshold for the minimum angle to triangulate 3D points (in degrees). Points with a large triangulation angle are more accurate. Set a threshold of 0 to triangulate all points. Increase the threshold to                                                                                                                                                      |

| Control (UI)               | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                            |                  |               | retain the more accurate points.<br><br>As a rule of thumb, anything below 5 degrees is likely to be incorrect.                                                                                                                                                                                                                                                                                                                      |
| Density Threshold          | densityThreshold | 0             | Sets the threshold for the minimum density for points. Set a threshold of 0 to output all points and increase the threshold to highlight isolated points.                                                                                                                                                                                                                                                                            |
| Delete Rejected Points     | deleteRejected   | N/A           | Click to permanently delete points that are rejected by the <b>Angle</b> and <b>DensityThresholds</b> .<br><br><div>  <b>Tip:</b> To clean up the point cloud, try enabling <b>Output points per frame</b> and <b>Display rejected points</b>. You can then tune the <b>Post Filtering</b> thresholds and delete points at different frames. </div> |
| Output                     |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Point Size                 | pointSize        | 2             | Sets the size, in pixels, of points displayed in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                      |
| Output points per frame    | outputPerFrame   | off           | When enabled, only the points generated at the current frame are displayed in the Viewer.<br><br>When disabled, points from all tracked frames are displayed.                                                                                                                                                                                                                                                                        |
| Groups Tab                 |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Display groups in overlay  | displayGroups    | on            | When enabled, group colors are displayed as an overlay in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                             |
| Output visible groups only | outputGroups     | off           | When enabled, only points designated as part of a group on the <b>Groups</b> tab are displayed in the 3D Viewer.<br><br>You can label the point cloud using <b>Groups</b> to help                                                                                                                                                                                                                                                    |

| Python Tab (These controls are for Python callbacks and can be used to have Python functions automatically called when various events happen in Nuke.) |                   |               |                                                                                                                                                      |
| before render                                                                                                                                          | beforeRender      | none          | These functions run prior to starting rendering in execute(). If they throw an exception, the render aborts.                                         |
| before each frame                                                                                                                                      | beforeFrameRender | none          | These functions run prior to starting rendering of each individual frame. If they throw an exception, the render aborts.                             |
| after each frame                                                                                                                                       | afterFrameRender  | none          | These functions run after each frame is finished rendering. They are not called if the render aborts. If they throw an exception, the render aborts. |
| after render                                                                                                                                           | afterRender       | none          | These functions run after rendering of all frames is finished. If they throw an error, the render aborts.                                            |
| render progress                                                                                                                                        | renderProgress    | none          | These functions run during rendering to determine progress or failure.                                                                               |

# PreviewSurface

The PreviewSurface node represents the preview shader from the Universal Scene Description standard. It is a basic material that can be used as a standard solution when switching between pipelines and different applications. For example, a game pipeline may rely on metallic workflows and film on specular workflows. PreviewSurface supports either by enabling or disabling the **Use Specular Workflow** control.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                         |
|-----------------|-----------------|------------------------------------------------------------------|
| Input           | opa             | A hidden input that controls opacity in the shader preview.      |
|                 | N               | A hidden input that controls normals in the shader preview.      |
|                 | ao              | A hidden input that controls AOVs in the shader preview.         |
|                 | disp            | A hidden input that controls displacement in the shader preview. |
|                 | rough           | Controls roughness in the shader preview.                        |
|                 | Ce              | Controls emissive color in the shader preview.                   |
|                 | Cs              | Controls specular color in the shader preview.                   |
|                 | Cf              | Controls diffuse color in the shader preview.                    |

| Control (UI)          | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------|---------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PreviewSurface        |                     |               |                                                                                                                                                                                                                                                                                                                                                                           |
| Diffuse Color         | diffuseColor        | 0.18          | Controls the amount of diffuse color applied in the shader from the <b>Cf</b> input.                                                                                                                                                                                                                                                                                      |
| Emissive Color        | emissiveColor       | 0             | Controls the amount of emissive color applied in the shader from the <b>Ce</b> input.                                                                                                                                                                                                                                                                                     |
| Use Specular Workflow | useSpecularWorkflow | off           | <p>When enabled, PreviewSurface uses the specular workflow preferred by film pipelines. The <b>Specular Color</b> slider controls the amount of specularity applied in the shader.</p> <p>When disabled, PreviewSurface uses the metallic workflow preferred by games pipelines. The <b>Metallic</b> slider controls the amount of metallicity applied in the shader.</p> |
| Specular Color        | specularColor       | 0             | Controls the amount of specularity applied in the shader from the <b>Cs</b> input. This control is                                                                                                                                                                                                                                                                        |

| Control (UI)         | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                               |
|----------------------|---------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                      |                     |               | only available when <b>Use Specular Workflow</b> is enabled.                                                                                                                                                           |
| Metallic             | metallic            | 0             | Controls the amount of metallicity applied in the shader from the <b>Cs</b> input. This control is only available when <b>Use Specular Workflow</b> is disabled.                                                       |
| Roughness            | roughness           | 0.5           | Controls the amount of roughness applied in the shader from the <b>rough</b> input.                                                                                                                                    |
| Roughness Channel    | roughnessChannel    | rgba.red      | Sets the channel from which roughness information is taken.                                                                                                                                                            |
| Opacity              | opacity             | 1             | Controls the amount of opacity applied in the shader from the <b>opa</b> input.                                                                                                                                        |
| Opacity Channel      | opacityChannel      | rgba.alpha    | Sets the channel from which opacity information is taken.                                                                                                                                                              |
| Opacity Threshold    | opacityThreshold    | 0             | Sets the threshold below which the <b>Opacity</b> value is ignored. <b>Opacity</b> values less than the threshold are not rendered and <b>Opacity</b> values greater than or equal to the threshold are fully visible. |
| Refraction           | ior                 | 1.5           | Sets index of refraction to be used for translucent objects and objects with specular components. This includes clearcoat if the <b>Clearcoat</b> value is greater than 0.                                             |
| Clearcoat            | clearcoat           | 0             | Sets a secondary specular amount of white applied in the shader.                                                                                                                                                       |
| Clearcoat Roughness  | clearcoatRoughness  | 0.01          | Sets the amount of roughness applied to the <b>Clearcoat</b> value in the shader.                                                                                                                                      |
| Displacement         | displacement        | 0             | Controls the amount of displacement in the direction of the normal that is applied in the shader from the <b>disp</b> input.                                                                                           |
| Displacement Channel | displacementChannel | rgba.red      | Sets the channel from which displacement information is taken.                                                                                                                                                         |

# Project3DShader

The Project3DShader node projects an input image through a camera that you can bind to a prim using the GeoBindMaterial node or the **img** input, if the prim has one..

**Tip:** Project3DShader's classic 3D system equivalent is the [Project3D](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                               |
|-----------------|-----------------|--------------------------------------------------------|
| Input           | cam             | The Camera node controlling the projection attributes. |
|                 | unnamed         | The 2D image of the material you want to project.      |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                   |
|-----------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Project3DShader |                  |               |                                                                                                                                                                                                                                                                                                                                            |
| project on      | project_on       | both          | Controls whether the image is projected on the <b>front</b> facing, <b>back</b> facing, or <b>both</b> polygons.                                                                                                                                                                                                                           |
| crop            | crop             | on            | When enabled, the input image is cropped at the edge of the camera frustum.<br><br>When disabled, the last pixels of the 2D material within the camera frustum are extended to cover the prim.                                                                                                                                             |
| occlusion mode  | occlusion_mode   | none          | Sets the ray casting projection occlusion test mode: <ul style="list-style-type: none"> <li>• <b>none</b> - occlusion testing is disabled.</li> <li>• <b>self</b> - only the geometry to which this shader is bound can occlude the projection.</li> <li>• <b>world</b> - any geometry in the scene can occlude the projection.</li> </ul> |

# ScanlineRender2

When connected to a [GeoScene](#) or [GeoMerge](#) node, the ScanlineRender node renders all the objects and lights connected to that scene from the perspective of the [Camera](#) connected to the **cam** input (or a default camera if no **cam** input exists). The rendered 2D image is then passed along to the next node in the Node Graph, and you can use the result as an input to other nodes in the script.

The ScanlineRender node can also output deep data if there is Deep data available from the scene graph.

See also [GeoScene](#), [GeoMerge](#), and [Camera](#).

**Tip:** ScanlineRender2's classic 3D system equivalent is the [ScanlineRender](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | cam             | An optional camera input. The scene is rendered from the perspective of this camera. If the camera input is not connected, ScanlineRender uses a default camera positioned at the origin and facing in the negative Z direction.                                                                                                                                                       |
|                 | obj/scn         | Either: <ul style="list-style-type: none"> <li>• A GeoScene or GeoMerge node that is connected to the objects and lights you want to render, or</li> <li>• a 3D object or prim.</li> </ul>                                                                                                                                                                                             |
|                 | bg              | An optional background input. This can be used to composite a background image into the scene and to determine the output resolution. If not used, this defaults to <b>root.format</b> or <b>root.proxy_format</b> defined in the <b>ProjectSettings</b> .<br><br>If this input contains a depth channel, ScanlineRender considers it when doing Z-buffer and Z-blending calculations. |

| Control (UI)       | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ScanlineRender Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Objects Mask       | objects_mask     | //*           | <p>Specifies the mask pattern to match prim names to include in the output scene, excluding light prims such as <b>DirectLight1</b>.</p> <p>The default mask, <b>//*</b>, includes everything from the root of the scene graph. As you can see, you can use standard glob-style variables, such as <b>/*</b>, to create masks or use individual prim names separated by spaces. For example, <b>/GeoCube1 /GeoCard3</b> includes only those prims in the output scene.</p> <div>  <b>Tip:</b> You can also use the cog menu, the Viewer picker, or drag and drop paths from the Scene Graph to create masks. </div>              |
| Light Mask         | lights_mask      | //*           | <p>Specifies the mask pattern to match light names to include in the output scene, excluding object prims such as <b>GeoCube1</b>.</p> <p>The default mask, <b>//*</b>, includes everything from the root of the scene graph. As you can see, you can use standard glob-style variables, such as <b>/*</b>, to create masks or use individual prim names separated by spaces. For example, <b>/DirectLight1 /PointLight4</b> includes only those light prims in the output scene.</p> <div>  <b>Tip:</b> You can also use the cog menu, the Viewer picker, or drag and drop paths from the Scene Graph to create masks. </div> |
| transparency       | transparency     | on            | When enabled, objects appear transparent where their alphas are less than 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Z-blend mode     | zblend_mode      | none          | Type of ramp to use to blend two surfaces within the <b>Z-blend range</b> of each other. Smooth looks better, but linear is provided for back-compatibility.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Z-blend range    | zblend_range     | 0.1           | Any two surfaces closer together than this distance on the Z axis are blended together to smooth the transition between intersecting objects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Projection Mode  | projection_mode  | render camera | <p>The projection modes are:</p> <ul style="list-style-type: none"> <li>• <b>perspective</b> - have the camera's focal length and aperture define the illusion of depth for the objects in front of the camera.</li> <li>• <b>orthographic</b> - use orthographic projection (projection onto the projection plane using parallel rays).</li> <li>• <b>uv</b> - have every object render its UV space into the output format. You can use this option to cook out texture maps.</li> <li>• <b>spherical</b> - have the entire 360-degree world rendered as a spherical map. You can increase <b>tessellation max</b> to increase the accuracy of object edges as they are warped out of line, but this takes longer to render.</li> <li>• <b>render camera</b> - use the projection type of the render camera.</li> </ul> |
| Tessellation Max | max_tessellation | 3             | <p>Limits recursive subdivision of polygons by a screen-space distance percentage.</p> <p>This control can be useful in the <b>spherical</b> projection mode, which sometimes distorts object edges. If you see such distortions, you can try increasing this value to tessellate (subdivide) polygons into smaller polygons. This produces</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Control (UI)    | Knob (Scripting)     | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|----------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                      |               | more accurate object edges, but also takes longer to render.                                                                                                                                                                                                                                                                                                                                                              |
| Overscan        | overscan             | 0             | The maximum additional pixels to render beyond the left/right and top/bottom of the frame. Rendering pixels beyond the edges of the frame can be useful if subsequent nodes need to have access outside the frame. For example, a Blur node down the node tree may produce better results around the edges of the frame if overscan is used. Similarly, a subsequent LensDistortion node may require the use of overscan. |
| Lighting        | lighting_enable_mode | auto          | Controls whether or not lights in the scene affect the 2D output. Selecting <b>off</b> ignores the effect of any lights in the scene in the 2D Viewer, but you can still see the light's effect in the 3D Viewer.                                                                                                                                                                                                         |
| Ambient         | ambient              | 0             | Enter a value between 0 (black) and 1 (white) to change the global ambient color.                                                                                                                                                                                                                                                                                                                                         |
| MultiSample Tab |                      |               |                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Samples         | samples              | 1             | Sets the number of samples to render per pixel, to produce motion blur and antialiasing. If you use this, in most cases you can turn off the antialiasing and filter controls on the <b>ScanlineRender</b> tab.                                                                                                                                                                                                           |
| Shutter         | shutter              | 0.5           | Enter the number of frames the shutter stays open when motion blurring. For example, a value of 0.5 corresponds to half a frame.                                                                                                                                                                                                                                                                                          |
| Shutter Offset  | shutteroffset        | start         | <p>This value controls how the shutter behaves with respect to the current frame value. It has four options:</p> <ul style="list-style-type: none"> <li>• <b>centred</b> - center the shutter around the current frame. For example, if you set the shutter value to</li> </ul>                                                                                                                                           |

| Control (UI)    | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|---------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                     |               | <p>1 and your current frame is 30, the shutter stays open from frame 29,5 to 30,5.</p> <ul style="list-style-type: none"> <li>• <b>start</b> - open the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 30 to 31.</li> <li>• <b>end</b> - close the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29 to 30.</li> <li>• <b>custom</b> - open the shutter at the time you specify. In the field next to the dropdown menu, enter a value (in frames) you want to add to the current frame. To open the shutter before the current frame, enter a negative value. For example, a value of - 0.5 would open the shutter half a frame before the current frame.</li> </ul> |
|                 | shuttercustomoffset | 0             | <p>If the <b>shutter offset</b> parameter is set to <b>custom</b>, this parameter is used to set the time that the shutter opens by adding it to the current frame. Values are in frames, so -0.5 would open the shutter half a frame before the current frame.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Randomize Time  | temporal_jitter     | 0             | <p>Adds randomness to the distribution of samples in time so they don't produce regularly spaced images. The larger the value, the larger the time difference between the samples.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Sample Diameter | spacial_jitter      | 1             | <p>The diameter of the circle that the samples for each pixel are placed in for antialiasing. The larger the value, the more pixels are jittered.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Focus Diameter  | focal_jitter        | 0             | <p>Randomly orbit the camera about a point at the <b>focal distance</b> in front of it for each sample to produce depth-of-field effects from multiple samples.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Control (UI)         | Knob (Scripting)     | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------|----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                      |                      |               |  <b>Note:</b> The <b>focal distance</b> is set in the Camera node's controls, in the <b>Projection</b> tab.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Stochastic Samples   | stochastic_samples   | 0             | <p>Sets the number of samples, per pixel, to use in stochastic estimation (zero is disabled). Lower values result in faster renders, while higher values improve the quality of the final image.</p> <p>Stochastic sampling is based on Robert L. Cook's <i>Stochastic Sampling in Computer Graphics</i>, available in <i>ACM Transactions on Graphics</i>, Volume 6, Number 1, January 1996.</p>  <b>Note:</b> It is recommended for motion blur that the <b>samples</b> control is adjusted. This also provides anti-aliasing by jittering the sample point. |
| Uniform Distribution | uniform_distribution | off           | When enabled, use a uniform temporal distribution of scenes to sample. This generates more accurate results for stochastic multisampling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Shader Tab           |                      |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Motion Vectors       | motion_vectors_type  | distance      | <p>Select how to render motion vectors:</p> <ul style="list-style-type: none"> <li>• <b>off</b> - do not render motion vectors.</li> <li>• <b>classic</b> - render motion vectors the classic (pre-Nuke 6.1) way. This option is only provided for backwards compatibility, and isn't always accurate.</li> <li>• <b>velocity</b> - store the velocity of every single pixel in the motion vector channels (pre-Nuke 7.0 way). This option is only provided for backwards compatibility. In order to have the same behavior as Nuke 6.3, set <b>samples</b> to 1.</li> </ul>                                                                    |

| Control (UI)            | Knob (Scripting)        | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|-------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                         |                         |               | <ul style="list-style-type: none"> <li>• <b>distance</b> - for every pixel, store the distance (in pixels) between samples in the motion vector channels. This is the recommended option that usually produces the best results. It also allows the <a href="#">VectorBlur</a> node to produce curved vector blur where interpolation between two frames is made according to a curve rather than linearly.</li> </ul> |
| Motion Vector Channels  | MB_channel              | forward       | <p>The channels the motion vectors are output to.</p> <p>You can use the checkboxes on the right to select individual channels.</p>                                                                                                                                                                                                                                                                                    |
| Output Vectors          | output_shader_vectors   | off           | When enabled, shader vectors ( <b>surface points</b> and <b>surface normals</b> ) are output as well as motion vectors. These can be useful if you want to relight the rendered 3D scene in the compositing phase.                                                                                                                                                                                                     |
| Surface Point           | P_channel               | none          | The channel to use as the surface point channel. When <b>output vectors</b> is enabled, ScanlineRender outputs the surface point positions (in world space coordinates) into this channel.                                                                                                                                                                                                                             |
| Surface Normal          | N_channel               | none          | The channel to use as the surface normal channel. When <b>output vectors</b> is enabled, ScanlineRender outputs the surface point normals (in world space coordinates) into this channel.                                                                                                                                                                                                                              |

| Drop Zero Alpha Samples | drop_zero_alpha_samples | enabled       | <p>When enabled, deep samples with an alpha value of 0 do not contribute to the output.</p> <p>When disabled, deep samples with an alpha value 0 contribute to the output.</p>                                                                                                                                                                                                                                         |

# SpotLight

SpotLight nodes create a point in 3D space that emits a cone-shaped light in a given direction. A real world example of a spot light is a desk lamp.

See also [DirectLight](#), [EnvironmentLight](#), and [PointLight](#).

**Tip:** SpotLight's classic 3D system equivalent is the [Spot](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                  |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | look            | An optional input to force the light to "look" at an Axis node.                                                                                                                                                           |
|                 | axis            | An optional input to link the position, rotation, scale, and skew of the transformed 3D object(s) to an Axis node, so that the transformation controls on the Axis node override the corresponding controls on this node. |

**Tip:** If you've worked with other 3D applications, you may know the Axis node as a "null" or "locator" object.

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                      |
|---------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------|
| SpotLight Tab |                  |               |                                                                                                               |
| Cone Angle    | cone_angle       | 0             | Sets the spot light cone angle, which adjusts the spread of the light. Valid angles are from 0 to 90 degrees. |
| Cone Softness | cone_softness    | 0             | Unsupported in the current USD library version used                                                           |

| Control (UI)             | Knob (Scripting)         | Default Value | Function                                                                                                                                             |

| Skew            | skew             | 0, 0, 0       | Lets you skew the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Pivot Translate | pivot_translate  | 0, 0, 0       | When you make changes to a 3D object’s position, scaling, skewing, and rotation, these occur from the location of the object’s origin point or pivot. The pivot translate and rotate x, y, and z controls allow you to move and rotate the pivot point as required - you can even move it outside of the object. Subsequent transformations applied then occur relative to the new pivot point location and rotation.<br><br>You can hold down <b>Ctrl/Cmd</b> and drag the pivot point to a new location in the 3D Viewer. |
| Pivot Rotate    | pivot_rotate     | 0, 0, 0       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Local Matrix    |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Specify Matrix  | useMatrix        | N/A           | Enable this control to specify matrix values for the object you’re transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                                                                                                                                 |
| matrix          | matrix           | N/A           | The matrix displays values from the object’s transform, rotate, scale, skew, and pivot controls.<br><br>Check <b>Specify Matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.                                                                                                                                                                                                                                              |
| World Matrix    |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| cast shadows  | cast_shadows     | disabled      | When enabled, the light casts shadow as defined by the <b>Shadow</b> controls.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| shadow mode   | shadow_mode      | solid         | <p>Presents three shadow casting modes that affect shadows cast by objects, based on the objects' opacity:</p> <ul style="list-style-type: none"> <li>• <b>solid</b> - objects that cast shadows are considered to be completely solid. This option can be used with both ScanlineRender and PrmanRender.</li> <li>• <b>clipped alpha</b> - objects that cast shadows are considered to be transparent if the object's alpha is below the light's clipping threshold control in the Shadows tab. This option is only relevant if you are using ScanlineRender to render your shadows.</li> <li>• <b>full alpha</b> - shadows are calculated based on how light is reduced when it passes through non-opaque occluders. This option is only relevant if you are using ScanlineRender to render your shadows.</li> </ul> |
| filter        | filter           | cubic         | Determines the type of filter that the <b>shadow mode</b> uses when it's set to <b>clipped alpha</b> or <b>full alpha</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| scene epsilon | scene_epsilon    | 0.001         | <p>An offset that moves the sampling point away from the geometry surface, towards the light that is casting the shadow. Increasing this value can reduce self-shadowing artifacts.</p> <p>This only applies if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>full alpha</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Control (UI) | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|---------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| samples      | samples             | 1             | <p>Sets the number of samples for the light when generating soft shadows. If soft shadows in your scene appear dotty or noisy, try increasing this value. The higher the value, the smoother the soft the shadows become.</p> <p>This only applies when <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p>                                                                                                                                                                                                                                                                                           |
| sample width | sample_width        | 1             | <p>Sets the size of the light for soft shadows. This value determines the width of the soft area around the edge of a shadow. The higher the value, the larger the soft area.</p> <p>This control is <b>only</b> relevant if your shadows are generated using raytracing.</p>                                                                                                                                                                                                                                                                                                                                            |
| bias         | depthmap_bias       | 0.01          | <p>Sets the bias for the raytracing or shadow map. Increase this value if self shadowing artifacts appear in the image. This moves the surface sample point away from surface. Note, however, that if you increase the value too much, some shadows may start moving away from the base of the objects that cast them.</p> <p>This only applies when <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p>                                                                                                                                                                                              |
| slope bias   | depthmap_slope_bias | 0.001         | <p>Bias for the shadow map. This is like <b>bias</b>, but the offset is proportional to the slope of the depth map. This allows you to give a different offset to each value in the depth map, depending on the surface's slope relative to the light.</p> <p>If increasing <b>bias</b> reduced the existing self-shadowing artifacts but introduced more artifacts in other areas of the image, you may want to bring <b>bias</b> down a little and increase <b>slope bias</b> instead.</p> <p>This only applies if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or</p> |

| Control (UI)        | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|---------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     |                     |               | <b>clipped alpha.</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| clipping threshold  | clipping_threshold  | 0.5           | <p>Objects that are set to cast shadows are considered solid if their alpha is below the value set here.</p> <p>This only applies if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>clipped alpha</b>.</p>                                                                                                                                                                                                                                                                                                                                                    |
| jitter scale        | shadow_jitter_scale | 3             | <p>Sets the amount of jitter used when doing percentage-closer filtering (PCF) for soft shadows. A larger <b>jitter scale</b> value results in softer, more perceptually accurate shadows.</p> <p>PCF works by sampling the depth map at many different positions around the same spot. The final shadow value for that spot is an average of how many of the samples were occluded or visible from point of view of the light.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p> |
| depthmap resolution | depthmap_width      | 1024          | <p>Sets the resolution of the depth map. Larger values will result in a less crunchy edge, but will require more time to process.</p> <p>Note that you can also fix crunchy edges by increasing the number of <b>samples</b> instead of increasing the depth map resolution.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p>                                                                                                                                                    |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                      |
|--------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------|
| output mask  | shadow_mask      | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .      |
|              |                  | none          | Sets the channel you want to output the shadow map into. This can be enabled even if the <b>cast shadows</b> box is disabled. |

# WireFrameShader

The WireFrameShader node is used to apply a wireframe material to a prim.

**Tip:** WireFrameShader's classic 3D system equivalent is the [Wireframe](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                           |
|-----------------|-----------------|----------------------------------------------------|
| Input           | unnamed         | The 2D image you're using for the surface texture. |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                |
|---------------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WireFrameShader Tab |                  |               |                                                                                                                                                                                                         |
| Channels            | channels         | rgba          | <p>The material is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Operation    | operation        | opaque        | <p>Sets the wireframe render mode:</p> <ul style="list-style-type: none"> <li>• <b>opaque</b> - displays the wireframe over a solid black geometry.</li> <li>• <b>see through</b> - displays the wireframe over a fully transparent geometry so you can see the wires on all surfaces.</li> <li>• <b>over</b> - displays the wireframe over the input shader.</li> <li>• <b>multiply</b> - displays the wireframe multiplied by the input shader over a fully transparent geometry.</li> <li>• <b>modulate</b> - modulates the wireframe color by a standard diffuse contribution and displays over the input shader. This mode is affected by any lights in the scene.</li> </ul> |
| Line Width   | line-width       | 0.5           | Sets the width of the wireframe lines.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Line Color   | line_color       | 1             | Sets the color of the wireframe lines, multiplied by the alpha channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

# Classic 3D Nodes

Nuke's classic 3D nodes, superseded by the new USD-based nodes, deal with Nuke's 3D workspace, which allows you to set up a 3D composite for camera moves, set replacement, and other applications where you need to simulate a "real" dimensional environment.

## AmbientOcclusion

This shader node calculates ambient occlusion for 3D scenes rendered into 2D using the RayRender node. AmbientOcclusion is not supported by ScanlineRender or PrmanRender.

See also [RayRender](#).

### Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                           |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | Either: <ul style="list-style-type: none"><li>• The 2D image you're using for the surface texture, or</li><li>• Another shader node, such as Diffuse, Specular, or Emission. Adding several shader nodes one after the other allows you to produce more complex effects.</li></ul> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                              |
|--------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| samples      | samples          | 10            | Controls the number of rays used to detect if an object is occluded. Increasing the number of samples reduces noise and produces a better quality result, but increases render times. |
| spread       | spread           | 1             | Controls the angular spread around the normal in the range 0-1, where 1 is equal to 90° (the full hemisphere).                                                                        |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                      |
|--------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------|
| falloff      | falloff          | 0             | Sets the exponential falloff rate for the occlusion along the ray distance.                                   |
| near clip    | near             | 0             | Controls the minimum (near) and maximum (far) occlusion distances sampled when calculating ambient occlusion. |
| far clip     | far              | 10            |                                                                                                               |

# ApplyMaterial

Apply a material from the **mat** input to your 3D object(s). For example, you can use this node to apply a global material to several merged objects (note that this overrides any individual materials applied to the geometry before it was merged).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                            |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The 3D geometry object to which you want to apply a material. If you want to apply the same material to several objects, you can also connect a MergeGeo node here. |
|                 | mat             | The material you want to apply to your 3D object, for example, a BasicMaterial node.                                                                                |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                               |
|-------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ApplyMaterial Tab |                  |               |                                                                                                                                                                        |
| display           | display          | unchanged     | Adjust the display characteristics of the 3D object. These settings don't affect the render output of the scene; these are for display purposes only in the 3D Viewer. |

| Control (UI) | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|-------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                   |               | <ul style="list-style-type: none"> <li>• <b>off</b> - hides the 3D object.</li> <li>• <b>wireframe</b> - displays only the outlines of the object's geometry.</li> <li>• <b>solid</b> - displays all geometry with a solid color.</li> <li>• <b>solid+wireframe</b> - displays the geometry as solid color with the object's geometry outlines.</li> <li>• <b>textured</b> - displays only the surface texture.</li> <li>• <b>textured+wireframe</b> - displays the wireframe plus the surface texture.</li> <li>• <b>unchanged</b> - doesn't change the object's display mode. The Viewer can override this setting.</li> </ul>                         |
| selectable   | selectable        | enabled       | When enabled, you can make selections as normal in the Viewer. When disabled, points cannot be selected or changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| render       | render_mode       | unchanged     | Sets how the object will render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| filter       | filter_type       | all           | <p>Select the geometry objects to which the material is applied:</p> <ul style="list-style-type: none"> <li>• <b>all</b> - apply the material to all incoming geometry objects.</li> <li>• <b>name</b> - only apply the material to incoming geometry objects that match the filter name settings.</li> </ul> <div>  <b>Note:</b> For <b>name</b> to work, the geometry has to have a name attribute. The only nodes that add this attribute are ModelBuilder and ReadGeo (when reading in an Alembic and USD files), but third-party plug-ins can add it too. </div> |
|              | filter_name_match | contains      | Sets how to filter the incoming geometry objects to determine which objects the material is applied to:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | <ul style="list-style-type: none"> <li>• <b>equals</b> - set the material on any objects whose name matches the string in the filter name field exactly.</li> <li>• <b>doesn't equal</b> - set the material on any objects whose name does not match the string in the filter name field exactly.</li> <li>• <b>contains</b> - set the material for any objects whose name contains the string in the filter name field.</li> </ul> <p>This can be useful when you have some structure to your object names. For example, if you have objects like /Root/Chair/Seat, /Root/Chair/Back, and /Root/Table, you can select <b>contains</b> and set the filter name field to <b>chair</b> to apply the material to all parts of the chair while leaving the table alone.</p> <ul style="list-style-type: none"> <li>• <b>doesn't contain</b> - set the material for any objects whose name does not contain the string in the filter name field.</li> </ul> <p>This control is only available when <b>filter</b> is set to <b>name</b>.</p> |
|              | filter name      | N/A           | <p>The filter name to use to determine which objects the material is applied to. You can type the filter name directly into this field or use the <b>choose</b> button to select a filter name from a list of incoming geometry objects.</p> <p>This control is only available when <b>filter</b> is set to <b>name</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| choose       | filter_refresh   | N/A           | <p>Open the <b>Object Name Chooser</b> dialog. # Axis

Axis nodes act as null objects by adding a new transformational axis to which other objects may be parented. Even when objects already have their own internal axes, it's sometimes useful to parent in a separate axis. For example, when an Axis node is parented to other objects in a scene, the node globally controls the scene - rotating the axis rotates all objects in the scene.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | axis            | <p>An optional Axis node input. This links the position, rotation, scale, and skew of the transformed 3D object(s) to the Axis node, so that the transformation controls on the Axis node override the corresponding controls on the TransformGeo node.</p> <p>If you've worked with other 3D applications, you may know the Axis node as a "null" or "locator" object.</p> |
|                 | look            | <p>An optional input where you can connect a Camera, Light, or another Axis that the Axis is automatically rotated to point toward. The Axis automatically rotated to point towards the connected input whenever the <b>look</b> input is moved.</p>                                                                                                                        |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Axis Tab       |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                             |
| read from file | read_from_file   | disabled      | <p>When disabled, the axis is configured using the controls on the <b>Axis</b> tab. Enable <b>read from file</b> if you want to read in axis information from an .fbx file using the <b>File</b> tab.</p> <div>  <b>Note:</b> This control is linked to the <b>read from file</b> control on the <b>File</b> tab. </div> |

| Control (UI)                                                                        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| rotation order                                                                    | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| translate                                                                         | translate        | 0, 0, 0       | Lets you translate the 3D objects attached to the Axis node along the x, y, and z axes. You can also adjust translate values by clicking and dragging the axis in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                          |
| rotate                                                                            | rotate           | 0, 0, 0       | Lets you rotate the 3D objects attached to the Axis node around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                         |
| scale                                                                             | scaling          | 1, 1, 1       | Lets you scale the 3D objects attached to the Axis node on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
