The selected item can be identified in the <b>Load</b> column.</p> <p>Items in the <b>.usd</b> file that weren't originally loaded can still be viewed in scenegraph and loaded into the scene.</p> <div>  <b>Note:</b> For more information about importing Axes from a <b>.usd</b> file, see <a href="#">Importing USD Items</a>. </div> |
| animation stack name | fbx_take_name    | N/A           | When the <b>file</b> control is pointing to a valid .fbx file, select the required <b>take name</b> from the dropdown menu.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| node name            | fbx_node_name    | N/A           | When the <b>file</b> control is pointing to a valid .fbx file, select the required <b>node name</b> from the dropdown menu.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| frame rate           | frame_rate       | 24            | When <b>use frame rate</b> is enabled, enter the required frame rate to use instead of the rate specified in the input file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| use frame rate       | use_frame_rate   | disabled      | When enabled, the frame rate from the input file is ignored and the specified <b>frame rate</b> is used instead.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Look Tab             |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| look axis            | look_axis        | -Z            | The axis around which the Axis is rotated to face the <b>look</b> input.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| rotate X             | look_rotate_x    | enabled       | Determines whether the rotation occurs around the X                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Control (UI)    | Knob (Scripting)     | Default Value | Function                                                                                                                                                                   |
|-----------------|----------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                      |               | axis. Note that for the rotation to truly "look at" the <b>look</b> input, all three of these options must be activated.                                                   |
| rotate Y        | look_rotate_y        | enabled       | Determines whether the rotation occurs around the Y axis. Note that for the rotation to truly "look at" the <b>look</b> input, you have to set all three of these options. |
| rotate Z        | look_rotate_z        | enabled       | Determines whether the rotation occurs around the Z axis. Note that for the rotation to truly "look at" the <b>look</b> input, you have to set all three of these options. |
| look strength   | look_strength        | 1             | Determines to what extent the Axis rotates to the new orientation. The smaller the value, the less the object is rotated. Setting the value to 0 produces no rotation.     |
| use quaternions | look_use_quaternions | disabled      | Uses an alternate scheme to calculate the <b>look</b> rotation. This option may be useful to smooth out erratic rotations along the look axis.                             |

# BasicMaterial

This node lets you control what material your objects seem to be made of. It combines the Diffuse, Specular, and Emission nodes, allowing you to control all three aspects of the material with a single node.

**Note:** To see the effect of your changes to an object's material properties, you need to have at least one light node in your Scene. You also need to enable transparency and lighting in the Viewer settings. Press **S** over the 3D Viewer, and check **transparency** and **headlamp** on the **3D** tab.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                              |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | mapSh           | An optional mask for varying the shininess value. Where the mask is black, the shininess is set to <b>min shininess</b> . Where the mask is white, the shininess is set to <b>max shininess</b> . Values in between (where the matte is gray) are attenuated accordingly.             |
|                 | mapS            | An optional mask for limiting the effect of the specular component. Any changes you make to <b>specular</b> are limited to the non-black areas of the mask.                                                                                                                           |
|                 | mapE            | An optional mask for limiting the effect of the emissive component. Any changes you make to <b>emission</b> are limited to the non-black areas of the mask.                                                                                                                           |
|                 | mapD            | An optional mask for limiting the effect of the diffuse component. Any changes you make to <b>diffuse</b> are limited to the non-black areas of the mask.                                                                                                                             |
|                 | unnamed         | Either: <ul style="list-style-type: none"> <li>• The 2D image you're using for the surface texture, or</li> <li>• Another shader node, such as Diffuse, Specular, or Emission. Adding several shader nodes one after the other allows you to produce more complex effects.</li> </ul> |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                        |
|-------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BasicMaterial Tab |                  |               |                                                                                                                                                                                                 |
| channels          | channels         | rgb           | The effect is only applied to these channels.<br><br>If you set this to something other than <b>all</b> or <b>none</b> , you can use the checkboxes on the right to select individual channels. |
| emission          | emission         | 0             | Sets the color of the light the material emits. Note that                                                                                                                                       |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| shininess channel | shininess_channel | luminance     | <p>Selects which channel from the <b>mapSh</b> input is used to map the black and white values to the <b>minshininess</b> and <b>maxshininess</b> controls. Choose:</p> <ul style="list-style-type: none"> <li>• <b>red</b> - use the red channel for the mapping.</li> <li>• <b>green</b> - use the green channel.</li> <li>• <b>blue</b> - use the blue channel.</li> <li>• <b>alpha</b> - use the alpha channel.</li> <li>• <b>luminance</b> - use the luminance.</li> <li>• <b>average rgb</b> - use the average of the red, green, and blue channels.</li> </ul> |

# BlendMat

The BlendMat node sets how the pixels colored by the material it is applied to combine with the pixels from objects behind. It is like the MergeMat node, but instead of blending with another material, it blends with whatever is rendered behind in the 3D scene.

**Note:** Multiple BlendMat operations on the same layer may produce unexpected results.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                        |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The 2D image you're using for the material to merge with the background pixels in the 3D scene. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| operation    | operation        | over          | <p>Select how you want to composite the BlendMat node's input material and the background pixels together:</p> <ul style="list-style-type: none"> <li>• <b>none</b> - set the material to black.</li> <li>• <b>replace</b> - show the material where the material and the background overlap.</li> <li>• <b>over</b> - composite the material over the background pixels according to the material's alpha.</li> <li>• <b>stencil</b> - show the background pixels where the material's alpha is black. Where the material's alpha is white, the material is set to black. For this to work, the BlendMat node needs to process the alpha channel, so set channels to rgba. This operation is the opposite of mask.</li> <li>• <b>mask</b> - show the background pixels where the material's alpha is white. Where the material's alpha is black, the material is also set to black. For this to work, the BlendMat node needs to process the alpha channel, so set channels to rgba. This operation is the opposite of stencil.</li> <li>• <b>plus</b> - add the background pixels to the material.</li> </ul> |

| Control (UI)  | Knob (Scripting) | Default Value  | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

# Camera

Cameras may be connected to either the Scene node or the ScanlineRender node. Camera connected to a ScanlineRender node define the projection for use by the 3D renderer. You can connect additional cameras to the Scene node and switch between them by choosing the viewing camera from the dropdown menu at the top of the Viewer. You can also read in **.fbx**, **.abc**, and **.usd** scene files containing standard cameras, though only one camera per Camera node can be read.

Cameras can also be used to project 2D textures onto 3D objects in a scene using the controls on the **Projection** tab and a Project3D node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | axis            | <p>An optional Axis node input. This links the position, rotation, scale, and skew of the transformed 3D object(s) to the Axis node, so that the transformation controls on the Axis node override the corresponding controls on the TransformGeo node.</p> <p>If you've worked with other 3D applications, you may know the Axis node as a "null" or "locator" object.</p> |
|                 | look            | <p>An optional input where you can connect a Camera, Light, or Axis that the Light is automatically rotated to point toward. The Light is automatically rotated to point towards the connected input whenever the <b>look</b> input is moved.</p>                                                                                                                           |

| rotation order | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZXY, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| translate      | translate        | 0, 0, 0       | Lets you translate the camera along the x, y, and z axes. You can also adjust translate values by clicking and dragging the camera in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                 |
| rotate         | rotate           | 0, 0, 0       | Lets you rotate the camera around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                  |
| scale          | scaling          | 1, 1, 1       | Lets you scale the camera on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| uniform scale  | uniform_scale    | 1             | Lets you scale the camera simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| skew           | skew             | 0, 0, 0       | Lets you skew the camera on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| pivot          | pivot            | 0, 0, 0       | <p>When you make changes to a camera's position, scaling, skewing, and rotation, these occur from the location of the camera's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |
| Local Matrix   |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| specify matrix | useMatrix        | N/A           | Enable this control to specify matrix values for the camera you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                                                                                                                          |
| matrix         | matrix           | N/A           | <p>The matrix displays values from the camera's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p>                                                                                                                                                                                                                                |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| frame rate                   | frame_rate       | 24            | <p>When <b>use frame rate</b> is enabled, enter the required frame rate to use instead of the rate specified in the input file.</p>                                                                                                                                                                                                                         |
| use frame rate               | use_frame_rate   | disabled      | <p>When enabled, the frame rate from the input file is ignored and the specified <b>frame rate</b> is used instead.</p>                                                                                                                                                                                                                                     |
| suppress confirmation dialog | suppress_dialog  | disabled      | <p>When enabled, importing new camera data does not display a confirmation prompt.</p>                                                                                                                                                                                                                                                                      |
| compute rotation             | compute_rotation | disabled      | <p>When enabled, compute the camera rotation values using the look up vector and look at position. The rotation values are always computed when there is a look at target.</p>                                                                                                                                                                              |

| Control (UI)    | Knob (Scripting)     | Default Value | Function                                                                                                                                                                     |
|-----------------|----------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Look Tab        |                      |               |                                                                                                                                                                              |
| look axis       | look_axis            | -Z            | The axis around which the Camera is rotated to face the <b>look</b> input.                                                                                                   |
| rotate X        | look_rotate_x        | enabled       | Determines whether the rotation occurs around the X axis. Note that for the rotation to truly "look at" the <b>look</b> input, all three of these options must be activated. |
| rotate Y        | look_rotate_y        | enabled       | Determines whether the rotation occurs around the Y axis. Note that for the rotation to truly "look at" the <b>look</b> input, you have to set all three of these options.   |
| rotate Z        | look_rotate_z        | enabled       | Determines whether the rotation occurs around the Z axis. Note that for the rotation to truly "look at" the <b>look</b> input, you have to set all three of these options.   |
| look strength   | look_strength        | 1             | Determines to what extent the Camera rotates to the new orientation. The smaller the value, the less the object is rotated. Setting the value to 0 produces no rotation.     |
| use quaternions | look_use_quaternions | disabled      | Uses an alternate scheme to calculate the <b>look</b> rotation. This option may be useful to smooth out erratic rotations along the look axis.                               |

# CameraTracker

CameraTracker (NukeX and Nuke Studio only) is designed to provide an integrated camera tracking or matchmoving tool, allowing you to create a virtual camera whose movement matches that of your original camera. Tracking camera movement in a 2D footage enables you to add virtual 3D objects to your 2D footage.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                  |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | Source          | The sequence whose camera movement you want to track.                                                                                                                                                     |
|                 | Mask            | <p>An optional input to use as a mask. By default, feature tracking is limited to the non-black areas of the mask.</p> <p>The <b>Mask</b> input is hidden until the <b>Source</b> input is connected.</p> |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                   |                     |               | option. Use this option if the focal length is unknown and there is no zoom.                                                                                                                                                                                                                                                                                                                                               |
| Length            | knownFocalLength    | 50            | Sets the focal length for approximate and known solves. You can animate this control to define a varying focal length. The units are the same as those used for the <b>Film Back Size</b> (mm or inches).                                                                                                                                                                                                                  |
| Film Back Preset  | filmBackSizePresets | Custom        | <p>Sets the <b>Film Back Size</b> controls automatically, depending on which preset you choose.</p> <p>The default setting allows you to enter your own settings manually.</p> <div>  <b>Tip:</b> You can add your own defaults by editing the <code>../NukeScripts/camerapresets.py</code> file in the Nuke installation package. </div> |
| Film Back Size xy | filmBackSize        | 36,24         | Sets the size of the camera imaging sensor. Specify the units you want to use by selecting either millimeters or inches in the <b>Units</b> dropdown. The units should match the units used for the <b>Length</b> .                                                                                                                                                                                                        |
| Units             | filmbackUnits       | mm            | Sets the unit of measure for the <b>Film Back Size</b> , either millimeters or inches.                                                                                                                                                                                                                                                                                                                                     |
| Analysis          |                     |               |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Track             | trackFeatures       | N/A           | Click to begin auto-tracking using the controls specified in the <b>Settings</b> tab. Track defines a set of 2D feature tracks that correspond to fixed points, or features, in the scene.                                                                                                                                                                                                                                 |
| Update Track      | updateTrack         | N/A           | Click to display a frame range dialog, allowing                                                                                                                                                                                                                                                                                                                                                                            |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                             |
|--------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | you to retrack part of the sequence, such as when you have extended the frame range or used some of the <b>Settings</b> tab <b>Tracking</b> refinement controls.                                                                                                                                                                                                                     |
| Clear Tracks | clearTrack       | N/A           | Click to clear all auto-tracking data. A confirmation message needs acknowledging before the action is completed.                                                                                                                                                                                                                                                                    |
| Solve        | solveCamera      | N/A           | Click to begin calculating the solve using the controls specified in the <b>Settings</b> tab. Solve calculates the camera path and projection creating a 3D point for each 2D feature track within a minimum projection error, including auto-tracks, User Tracks, and tracks created from imported Trackers.                                                                        |
| Update Solve | updateSolve      | N/A           | <p>Click to update the solve calculation, such as when you have extended the frame range or used some of the <b>Settings</b> tab <b>Solving</b> refinement controls.</p> <p>Recalculating the solve is handy when you want to see how good the solve is after you've refined it, without permanently deleting tracks. Recalculating the solve also recalculates stereo geometry.</p> |
| Clear Solve  | resetSolve       | N/A           | Click to clear all solve data. A confirmation message needs acknowledging before the action is completed.                                                                                                                                                                                                                                                                            |
| Error        | solveRMSE        | N/A           | Displays the RMS (root mean square) error of your solve, in pixels. As a general rule of thumb, if your solve reports an RMS projection rate higher than 1.0 pixel, you may want to consider fine-tuning your solve or tracking data.                                                                                                                                                |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Delete Rejected          | deleteRejectedTracks | N/A           | Click to delete any tracks rejected by the threshold controls.                                                                                                                         |
| Delete Auto-tracks       | deleteAutoTracks     | N/A           | Click to delete all auto-tracks from the script, while retaining User Track and solve data. You can use this button to reduce the size of the script once you're happy with the solve. |
| Settings Tab             |                      |               |                                                                                                                                                                                        |
| Features                 |                      |               |                                                                                                                                                                                        |
| Number of Features       | numberFeatures       | 150           | Sets the number of features to track in each frame - ideally you should use more than 100 tracks per frame.                                                                            |
| Detection Threshold      | featureThreshold     | 0.1           | Sets the distribution of features over the input image. Low values track features evenly on all parts of the image.                                                                    |
| Feature Separation       | featureSpearation    | 12            | Sets the distribution of features in relation to each other. High values spread features at even distances over the image.                                                             |
| Refine Feature Locations | refineFeatures       | off           | When enabled, lock detected features to local corners. CameraTracker finds the closest corner point in your footage and locks feature points to them.                                  |
| Preview Features         | previewFeatures      | off           | When enabled, preview the potential features available for tracking. This allows you to check that the features cover the image. If not, tweak the tracking controls before tracking.  |
| Tracking                 |                      |               |                                                                                                                                                                                        |
| Minimum Length           | minTrackLength       | 3             | Sets a threshold value for the minimum track length to reject short tracks. You might find a                                                                                           |

| Control (UI)      | Knob (Scripting)     | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------|----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   |                      |               | lot of short tracks cropping up in long sequences with a slow camera movement.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Track Threshold   | matchThreshold       | 0.69999999    | Controls how similar features look over a number of frames. You can adjust this value to test whether a track is reliable.                                                                                                                                                                                                                                                                                                                                                                                                                |
| Track Smoothness  | smoothnessThreshold  | 0.1           | Sets the threshold for smooth track generation. Adjusting this value can be useful in preventing poor tracks in complex sequences. Increase the smoothness value to remove tracks that glitch over time.                                                                                                                                                                                                                                                                                                                                  |
| Track Consistency | consistencyThreshold | 0             | Sets the threshold for consistent track generation. Increase this value to ensure track motion is locally consistent. Adjust consistency to prevent poor tracks in complex sequences.                                                                                                                                                                                                                                                                                                                                                     |
| Solving           |                      |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Principal View    | principalView        | left          | <p>Sets the principal view where features are tracked and the <b>Mask</b> input is applied. The secondary camera is calculated relative to this <b>Principal View</b> camera.</p> <p>This control also appears on the <b>CameraTracker</b> tab.</p> <div>  <p><b>Note:</b> Principal View is only displayed if you have set up more than one view in your <b>Project Settings</b> (typically, if you're working on a stereoscopic project).</p> </div> |
| Camera Motion     | cameraMotion         | Free Camera   | <p>Sets the type of camera motion to compensate for:</p> <ul style="list-style-type: none"> <li>• <b>Rotation Only</b> - select this if the camera is</li> </ul>                                                                                                                                                                                                                                                                                                                                                                          |

| Control (UI)                                                                                                                                                          | Knob (Scripting)            | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                                                       |                             |               | <p>stationary, but rotating.</p> <ul style="list-style-type: none"> <li>• <b>Free Camera</b> - select this if the camera is moving freely, rotating, and translating.</li> <li>• <b>Linear Motion</b> - select this if the camera motion is a straight, linear path.</li> <li>• <b>Planar Motion</b> - select this if the camera has a flat path, moving in a two-dimensional plane only.</li> </ul> |
| Keyframe Spacing                                                                                                                                                      | keyFrameSeparation          | 0.30000001    | Controls the separation between keyframes. Use a high separation to spread keyframes out in long sequences with small camera movements. Use a low separation to generate more keyframes for fast camera moves.                                                                                                                                                                                       |
| Smoothness                                                                                                                                                            | motionSmoothness            | 0             | Adjusts the smoothness of your camera path. Increase this value to add weighting to the camera path and create a smoother result.                                                                                                                                                                                                                                                                    |
| Reference Frame                                                                                                                                                       | rootReferenceFrame          | 0             | When <b>Set reference frame</b> is enabled, specifies the first frame to use as a keyframe in the solve. This should be a frame where there is a large number of tracks distributed over the image with a good variation in depth.                                                                                                                                                                   |
| Set reference frame                                                                                                                                                   | setRootFrame                | off           | When enabled, use the Reference Frame field to manually define how keyframes are specified in the sequence. This can be useful if you have a difficult sequence to solve.                                                                                                                                                                                                                            |
| Stereo (These controls are only displayed if you have set up more than one view in your <b>Project Settings</b> , typically when working on a stereoscopic projects.) |                             |               |                                                                                                                                                                                                                                                                                                                                                                                                      |
| Aligned Stereo Cameras                                                                                                                                                | alignSecondary Cameras      | on            | When enabled, the solve aligns secondary cameras to the principal camera position.                                                                                                                                                                                                                                                                                                                   |

## Card Parameters

|           |           |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-----------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| scale xyz | cardScale | 1,1,1 | Equivalent value for the <b>scale</b> parameter on the <a href="#">Card</a> node, used to produce horizontal scale in conjunction with the <b>Radial Distortion</b> controls.                                                                                                                                                                                                                                                                                                             |
| a (r^3)   | a         | 0     | <p>Equivalent value for the <b>a (r^3)</b> control on <b>LensDistortion</b> tab of the <a href="#">Card</a> node. Defines a cubic term that affects the radial distortion of the texture applied to the card, and the edges of the card.</p> <p>This allows you to distort an image projected onto a card in 3D, for example, to simulate camera lens distortion effects, such as barrel distortion.</p> <p>Positive values make the card rounder, negative make the corners sharper.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| $b (r^2)$    | b                | 0             | <p>Equivalent value for the <b>b (<math>r^2</math>)</b> control on <b>LensDistortion</b> tab of the <a href="#">Card</a> node. Defines a square term that affects the radial distortion of the texture applied to the card, and the edges of the card.</p> <p>This allows you to distort an image projected onto a card in 3D, for example, to simulate camera lens distortion effects, such as barrel distortion.</p> <p>Positive values make the card rounder, negative make the corners sharper.</p> |
| $c (r^1)$    | c                | 0             | <p>Equivalent value for the <b>c (<math>r^1</math>)</b> control on <b>LensDistortion</b> tab of the <a href="#">Card</a> node. Defines a linear term that affects the radial distortion of the texture applied to the card, and the edges of the card.</p> <p>This allows you to distort an image projected onto a card in 3D, for example, to simulate camera lens distortion effects, such as barrel distortion.</p> <p>Positive values make the card rounder, negative make the corners sharper.</p> |

# Card

The Card node creates the simplest type of object you can add to a 3D scene - a plane onto which you can map a texture. A card object may be distorted using the **Lens Distortion** tab or deformed as a bilinear or bicubic object using the **Deform** tab.

## Inputs and Controls

| Connection Type | Connection Name | Function                                        |
|-----------------|-----------------|-------------------------------------------------|
| Input           | img             | The texture you want to project on to the card. |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| cp                | control_points    | N/A           | <p>This collection of controls is used to navigate around the control points on the card. The index starts at 0 and each control point is described by two grid locations and <b>xyz</b> values corresponding to the position, right tangent, left tangent, up tangent, and down tangent - tangent values are relative to the position value.</p> <ul style="list-style-type: none"> <li>• The left and right arrows change the column index of the control point.</li> <li>• The up and down arrows change the row index of the control point.</li> </ul> <div>  <b>Note:</b> Control points along the edge of the card only display tangent values if they are valid. For example, the lower left corner control point only displays the up and right tangents. </div> |

# CrosstalkGeo

With the CrosstalkGeo node, you can move the XYZ points on your geometry using the crosstalk curves for each axis.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                  |
|-----------------|-----------------|-----------------------------------------------------------|
| Input           | unnamed         | The 3D geometry object whose vertices you want to adjust. |

| Control (UI)       | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Reset        | N/A              | N/A           | Resets the selected curves to their initial positions.                                                                                                                                                                                                            |

# Cube

The Cube node creates an adjustable cube in a 3D scene. You can map a texture on to the cube by attaching an image to the **img** input.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                  |
|-----------------|-----------------|-----------------------------------------------------------|
| Input           | img             | The texture you want to project on to the object's faces. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                        |
|--------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cube Tab     |                  |               |                                                                                                                                                                                                                                                                                                                                                 |
| display      | display          | textured      | Adjusts the display characteristics of the 3D object. These settings don't affect the render output of the scene; these are for display purposes only in the 3D Viewer. <ul style="list-style-type: none"> <li>• <b>off</b> - hides the 3D geometry object.</li> <li>• <b>wireframe</b> - displays only the outlines of the object's</li> </ul> |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| selectable      | selectable       | enabled       | When enabled, you can make selections as normal in the Viewer. When disabled, points cannot be selected or changed.                                                                                                                                                                                                                                                                                 |
| render          | render_mode      | textured      | Sets how the object will render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                                                                                                                                                                                                                          |
| cast shadows    | cast_shadow      | enabled       | When enabled, the cube object can cast shadows.                                                                                                                                                                                                                                                                                                                                                     |
| receive shadows | receive_shadow   | enabled       | When enabled, and a material shader has been added, the cube object can have shadows cast onto it by other objects.                                                                                                                                                                                                                                                                                 |
| frame range     | frame_first      | 1             | Sets the start frame for the frame range displayed in the Viewer when the Timeline range is set to <b>Input</b> . This can be used to display the offset used in the TimeOffset node.                                                                                                                                                                                                               |
|                 | frame_last       | 1             | Sets the end frame for the frame range displayed in the Viewer when the Timeline range is set to <b>Input</b> . This can be used to display the offset used in the TimeOffset node.                                                                                                                                                                                                                 |
| rows/columns    | rows             | 10            | Sets the number of rows on each face of the object. The maximum value is 512, but high values may cause instability.                                                                                                                                                                                                                                                                                |
|                 | columns          | 10            | Sets the number of columns on each face of the object. The maximum value is 512, but high values may cause instability.                                                                                                                                                                                                                                                                             |

| Control (UI)                                                                        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|-----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| transform order | xform_order      | SRT           | Sets the operation order for scale (S), rotation (R), and translation (T). The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                                                                                                                        |
| rotation order  | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZXY, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| translate       | translate        | 0, 0, 0       | Lets you translate the object along the x, y, and z axes. You can also adjust translate values by clicking and dragging the object in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                    |
| rotate          | rotate           | 0, 0, 0       | Lets you rotate the object around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                     |
| scale           | scaling          | 1, 1, 1       | Lets you scale the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| uniform scale   | uniform_scale    | 1             | Lets you scale the object simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| skew            | skew             | 0, 0, 0       | Lets you skew the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| pivot           | pivot            | 0, 0, 0       | <p>When you make changes to a 3D object's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |
| Local Matrix    |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| specify matrix  | useMatrix        | N/A           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                                                                                                                             |
| matrix          | matrix           | N/A           | The matrix displays values from the object's transform,                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                      |
|--------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | <p>rotate, scale, skew, and pivot controls.</p> <p>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p> |

# Cylinder

The Cylinder node creates an adjustable cylinder in a 3D scene. You can map a texture on to the cylinder by attaching an image to the **img** input.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                 |
|-----------------|-----------------|----------------------------------------------------------|
| Input           | img             | The texture you want to project on to the object's face. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cylinder Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| display      | display          | textured      | <p>Adjusts the display characteristics of the 3D object. These settings don't affect the render output of the scene; these are for display purposes only in the 3D Viewer.</p> <ul style="list-style-type: none"> <li>• <b>off</b> - hides the 3D geometry object.</li> <li>• <b>wireframe</b> - displays only the outlines of the object's geometry.</li> <li>• <b>solid</b> - displays all geometry with a solid color.</li> <li>• <b>solid+wireframe</b> - displays the geometry as solid</li> </ul> |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                           |

The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZXY, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| translate       | translate        | 0, 0, 0       | Lets you translate the object along the x, y, and z axes. You can also adjust translate values by clicking and dragging the object in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                    |
| rotate          | rotate           | 0, 0, 0       | Lets you rotate the object around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                     |
| scale           | scaling          | 1, 1, 1       | Lets you scale the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| uniform scale   | uniform_scale    | 1             | Lets you scale the object simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| skew            | skew             | 0, 0, 0       | Lets you skew the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| pivot           | pivot            | 0, 0, 0       | <p>When you make changes to a 3D object's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                              |
|----------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local Matrix   |                  |               |                                                                                                                                                                                                                                                                                       |
| specify matrix | useMatrix        | N/A           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                           |
| matrix         | matrix           | N/A           | <p>The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p> |

# DepthGenerator

The DepthGenerator node (NukeX and Nuke Studio only) allows you to generate a depth map from your footage. The node uses information from a tracked camera to create a channel that displays variations in depth.

A depth map is an image that uses the brightness of each pixel to specify the distance between the 3D scene point and the virtual camera used to capture the scene.

DepthGenerator also allows you to output depth as normals and position passes, and create a [Card3D](#) node positioned in 3D space and displaced according to the depth channel.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                             |
|-----------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | Mask            | <p>The mask used to ignore areas of the source image. DepthGenerator expects alpha values of either 0 (for regions to use) or 1 (for regions to ignore).</p> <p>Depth can only be calculated where the real world 3D position of</p> |

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                 | <p>objects doesn't change. If there are moving objects in your <b>Source</b> footage, DepthGenerator is likely to struggle to create an accurate depth map for those regions. To prevent this, you can exclude moving foreground regions from the depth calculation by connecting a matte to this input and setting <b>Ignore Mask</b> in the DepthGenerator properties to the channel that contains the matte.</p> <p>The <b>Mask</b> input only appears once you've connected the other two inputs.</p> |
|                 | Camera          | A tracked Camera that matches the Source footage. If necessary, you can create one using the <a href="#">CameraTracker</a> node.                                                                                                                                                                                                                                                                                                                                                                          |
|                 | Source          | The source footage from which the Camera track was derived.                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Control (UI)       | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Mark Bad Regions | markRegions      | disabled      | When enabled, the regions where the depth calculation is ambiguous are marked in the depth map as very large values. |

# DepthToPoints

DepthToPoints is a gizmo containing the [DepthToPosition](#) and [PositionToPoints](#) nodes. It can be used to generate a 3D point cloud from a depth pass and 3D camera.

See also [DepthToPosition](#), [PositionToPoints](#), [DepthGenerator](#), and [Camera](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                  |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | camera          | The camera required by the DepthToPosition node to create the position pass from the depth pass.                                          |
|                 | image           | The image from which the point cloud is generated, and where all the depth data resides. This is also where the color information for the |

| Connection Type | Connection Name | Function                                                                                                                                |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------|
|                 |                 | point cloud is taken from.                                                                                                              |
|                 | norm            | The image containing normals data. Note that this input takes the place of the channels specified in the <b>surface normal</b> control. |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| selectable     | selectable       | enabled       | When enabled, you can make selections as normal in the Viewer. When disabled, points cannot be selected or changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| render         | render_mode      | solid         | Sets how the points will render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| cast shadow    | cast-shadow      | enabled       | When enabled, and a material shader is added to the object, the object can cast shadows.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| receive shadow | receive_shadow   | enabled       | When enabled, and a material is added to the object, the object can receive shadows.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| frame range    | range_first      | 1             | Sets the start frame for the frame range displayed in the Viewer when the Timeline range is set to <b>Input</b> . This can                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                            |
|----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |               | be used to display the offset used in the TimeOffset node.                                                                                                                          |
|                | range_last       | 1             | Sets the end frame for the frame range displayed in the Viewer when the Timeline range is set to <b>Input</b> . This can be used to display the offset used in the TimeOffset node. |
| depth          | depth            | depth.Z       | Sets the channel that you want to use for the depth.                                                                                                                                |
| invert depth   | invert           | disabled      | Invert the depth before processing the depth pass image. This is best used when the depth channel is z, as opposed to 1/z.                                                          |
| surface normal | N_channel        | none          | The point normals are taken from these channels in the first input. If the <b>norm</b> input is used, these channels are ignored.                                                   |
| point detail   | detail           | 0.5           | Controls the number of available points to display in the Viewer. A value of 0 means no points are displayed. A value of 1 displays all available points.                           |
| point size     | pointSize        | 5             | Controls the display size of the points in the Viewer.                                                                                                                              |

# DepthToPosition

Generates a position pass from a depth pass and a 3D camera.

See also [DepthToPoints](#), [PositionToPoints](#), [DepthGenerator](#), and [Camera](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                   |
|-----------------|-----------------|--------------------------------------------------------------------------------------------|
| Input           | camera          | The 3D tracked camera that corresponds to the image input.                                 |
|                 | image           | The image from which the position pass is generated, and where all the depth data resides. |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                                                     |
|---------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------|
| DepthToPosition Tab |                  |               |                                                                                                                              |
| output              | output           | rgb           | Specifies the channels the output position pass is put into, and includes the option to create a new layer for this purpose. |
| depth               | depth            | depth.Z       | Sets the channel that you want to use for the depth.                                                                         |
| invert depth        | invert           | disabled      | Invert the depth before processing the depth pass image. This is best used when the depth channel is z, as opposed to 1/z.   |
| far                 | far              | 10000         | Specifies a value at which depth beyond this distance from the camera are ignored when calculating the position pass.        |

# Diffuse

The Diffuse node lets you adjust the color of an illuminated material in a scene. The material appears darker as the surface points away from the light.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                              |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | map             | The image used to modulate the diffuse properties of the material.                                                                                                                                                                                                                    |
|                 | unnamed         | Either: <ul style="list-style-type: none"> <li>• The 2D image you're using for the surface texture, or</li> <li>• Another shader node, such as Diffuse, Specular, or Emission. Adding several shader nodes one after the other allows you to produce more complex effects.</li> </ul> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                        |
|--------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Diffuse Tab  |                  |               |                                                                                                                                                                                                                                                                                                 |
| channels     | channels         | rgba          | The effect is only applied to these channels.<br><br>You can use the checkboxes on the right to select individual channels.                                                                                                                                                                     |
| white        | white            | 0.18          | The color of the material when illuminated. Note that when you have an image connected to the unnamed input of the node and adjust this value, you need to look at the rendered 2D image to see the effect of your changes. Changing the white value does not have any effect in the 3D Viewer. |

# Direct

Direct lights emit parallel light in one direction and appear to illuminate all objects with equal intensity, as if it was coming from a far away source - you can use direct light to simulate sunlight and moonlight, for example. Being at an infinite distance from the objects, direct light has orientation, but no position. To generate accurate shadows from a Direct light, view the scene through the light (using the Viewer's camera dropdown menu, just like a camera) and adjust the Direct light's scale control so that the part of the scene that should cast shadows fits within the view. This ensures that none of the shadow-casting geometry is missed by the depth map.

See also [Light](#), [Spot](#), [Point](#), [Environment](#), and [Relight](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                  |
|-----------------|-----------------|-------------------------------------------|
| Input           | unnamed         | An Axis, a Camera, or another Light node. |

| Control (UI)                                                                        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| transform order | xform_order      | SRT           | Sets the operation order for scale (S), rotation (R), and translation (T). The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                                                                                                                        |
| rotation order  | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| translate       | translate        | 0, 0, 0       | Lets you translate the object along the x, y, and z axes. You can also adjust translate values by clicking and dragging the object in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                    |
| rotate          | rotate           | 0, 0, 0       | Lets you rotate the object around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                     |
| scale           | scaling          | 1, 1, 1       | Lets you scale the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| uniform scale   | uniform_scale    | 1             | Lets you scale the object simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| skew            | skew             | 0, 0, 0       | Lets you skew the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| pivot           | pivot            | 0, 0, 0       | <p>When you make changes to a 3D object's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| filter        | filter           | cubic         | Determines the type of filter that the <b>shadow mode</b> uses when it's set to <b>clipped alpha</b> or <b>full alpha</b> .                                                                                                                                                                                                                |
| scene epsilon | scene_epsilon    | 0.001         | <p>An offset that moves the sampling point away from the geometry surface, towards the light that is casting the shadow. Increasing this value can reduce self-shadowing artifacts.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>full alpha</b>.</p>         |
| samples       | samples          | 1             | <p>Sets the number of samples for the light when generating soft shadows. If soft shadows in your scene appear dotty or noisy, try increasing this value. The higher the value, the smoother the soft the shadows become.</p> <p>This control is only relevant when <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p> |
| sample width  | sample_width     | 1             | <p>Sets the size of the light for soft shadows. This value determines the width of the soft area around the edge of a shadow. The higher the value, the larger the soft area.</p> <p>This control is only relevant if your shadows are generated using raytracing.</p>                                                                     |
| bias          | depthmap_bias    | 0.01          | Sets the bias for the raytracing or shadow map. Increase this value if self shadowing artifacts appear in the image. This moves the surface sample point away from surface.                                                                                                                                                                |

| Control (UI)       | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|---------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    |                     |               | <p>Note, however, that if you increase the value too much, some shadows may start moving away from the base of the objects that cast them.</p> <p>This control is only relevant when <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                |
| slope bias         | depthmap_slope_bias | 0.01          | <p>Bias for the shadow map. This is like <b>bias</b>, but the offset is proportional to the slope of the depth map. This allows you to give a different offset to each value in the depth map, depending on the surface's slope relative to the light.</p> <p>If increasing <b>bias</b> reduced the existing self-shadowing artifacts but introduced more artifacts in other areas of the image, you may want to bring <b>bias</b> down a little and increase <b>slope bias</b> instead.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p> |
| clipping threshold | clipping_threshold  | 0.5           | <p>Objects that are set to cast shadows are considered transparent if their alpha is below the value set here.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>clipped alpha</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                           |
| jitter scale       | shadow_jitter_scale | 3             | <p>Sets the amount of jitter used when doing percentage-closer filtering (PCF) for soft shadows. A larger <b>jitter scale</b> value results in softer, more perceptually accurate shadows.</p> <p>PCF works by sampling the depth map at many different positions around the same spot. The final shadow value for that spot is an average of how many of the samples were occluded or visible from point of view of the light.</p>                                                                                                                                                                                                                        |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     |                  |               | This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b> .                                                                                                                                                                                                                                                                                        |
| depthmap resolution | depthmap_width   | 1024          | <p>Sets the resolution of the depth map. Larger values will result in a less crunchy edge, but will require more time to process.</p> <p>Note that you can also fix crunchy edges by increasing the number of <b>samples</b> instead of increasing the depth map resolution.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p> |
| output mask         | shadow_mask      | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                       |
|                     |                  | none          | Sets the channel you want to output the shadow map into. This can be enabled even if the <b>cast shadows</b> box is disabled.                                                                                                                                                                                                                                                                                                                  |

# DisplaceGeo

With the DisplaceGeo node, you can modify the shape of your 3D geometry object based on an image. When using the node, each vertex is displaced along its normal with a value corresponding to the image pixel the vertex's uv attribute points to. The higher the pixel value, the greater the displacement.

See also [Displacement](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                    |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The 3D geometry object you want to modify. This can be a Card node, for example. If you want to modify several objects together, you can also connect a MergeGeo node here. |
|                 | displace        | The image you want to use to modify the 3D geometry object.                                                                                                                 |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DisplaceGeo Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| display         | display          | unchanged     | <p>Adjust the display characteristics of the 3D object. These settings don't affect the render output of the scene; these are for display purposes only in the 3D Viewer.</p> <ul style="list-style-type: none"> <li>• <b>off</b> - hides the 3D geometry object.</li> <li>• <b>wireframe</b> - displays only the outlines of the object's geometry.</li> <li>• <b>solid</b> - displays all geometry with a solid color.</li> <li>• <b>solid+wireframe</b> - displays the geometry as solid color with the object's geometry outlines.</li> <li>• <b>textured</b> - displays only the surface texture.</li> <li>• <b>textured+wireframe</b> - displays the wireframe plus the surface texture.</li> <li>• <b>unchanged</b> - doesn't change the object's display mode. The Viewer can override this setting.</li> </ul> |
| selectable      | selectable       | enabled       | When enabled, you can make selections as normal in the Viewer. When disabled, points cannot be selected or changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| render          | render_mode      | unchanged     | Sets how the object will render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Normals are stored as a named attribute of a piece of geometry. <ul style="list-style-type: none"> <li>• <b>Cf</b> - surface color</li> <li>• <b>N</b> - normal</li> <li>• <b>PW</b> - world-space point</li> <li>• <b>uv</b> - texture coordinates</li> <li>• <b>vel</b> - point velocity.</li> </ul> |
| recalculate normals | recalc_normals   | enabled       | After the displacement, check this to recalculate the normals, which usually aren't correct after the vertices have been moved.                                                                                                                                                                                                                         |

# Displacement

Like the [DisplaceGeo](#) node, the Displacement shader node also performs displacement mapping, and at first glance the nodes seem very similar. However, the approach they have on performing displacement mapping is different.

Displacement mapping is a technique for adding geometric detail to object surfaces as you render them. Unlike the DisplaceGeo node, the Displacement node does this on the fly, only displacing those parts of the geometry that are visible at any given moment. Displacement considers the point of view of camera to determine which parts of the displacement need rendering, thus saving render time. It's also possible to optimize the level of tessellation to be the level that you need for an object at a certain distance.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                            |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Input           | normal          | An optional map for calculating the normals (an RGB image where each pixel corresponds to the X, Y, and Z coordinates of a surface) |

| displace threshold | displacement_displace_threshold | 0.01          | <p>Sets the displace threshold when detecting changes in the height of the displaced samples. The smaller the threshold, the higher the amount of tessellation.</p>  <b>Note:</b> The displacement <b>mode</b> must be set to <b>adaptive</b> to enable this control. |

# EditGeo

The EditGeo node lets you modify geometry, including point cloud meshes, by selecting vertices and manipulating them in the 3D Viewer. EditGeo also includes a **Transform** tab to translate, rotate, and scale 3D objects.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                          |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The 3D geometry object you want to edit. If you want to edit several objects together, you can also connect a <a href="#">MergeGeo</a> node here. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

# Emission

The Emission node simulates lamps or other sources that emit light.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                              |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | map             | The image used to modulate the emission properties of the material.                                                                                                                                                                                                                   |
|                 | unnamed         | Either: <ul style="list-style-type: none"> <li>• The 2D image you're using for the surface texture, or</li> <li>• Another shader node, such as Diffuse, Specular, or Emission. Adding several shader nodes one after the other allows you to produce more complex effects.</li> </ul> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                          |
|--------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Emission Tab |                  |               |                                                                                                                                                                                                                                                                                                   |
| channels     | channels         | rgba          | The effect is only applied to these channels.<br><br>You can use the checkboxes on the right to select individual channels.                                                                                                                                                                       |
| emission     | emission         | 0             | The color of the light the material emits. Note that when you have an image connected to the unnamed input of the node and adjust this value, you need to look at the rendered 2D image to see the effect of your changes. Changing the emission value does not have any effect in the 3D Viewer. |

## Environment

Environment lights illuminates objects using an image of light from a real-world environment. This image-based lighting is generated using High Dynamic Range (HDR) images.

To use environment light, you first need to shoot a real life environment as an HDR image. Using the SphericalTransform node, you then convert this image into a spherical mapped image. The sphere is used to surround the 3D objects, so that the mapped image color illuminates them.

Environment light only works with shiny object materials that can reflect the mapped image. It results in a very realistic lighting that makes it easier to integrate the objects into the environment.

See also [Light](#), [Spot](#), [Point](#), [Direct](#), and [Relight](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                   |
|-----------------|-----------------|------------------------------------------------------------|
| Input           | map             | The transformed HDR image to create the environment light. |
|                 | unnamed         | An Axis, a Camera, or another Light node.                  |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# FillMat

The FillMat node lets you replace selected material channels with a constant color. Typically, you would use this node to make one object hold out the others, similar to using a black Constant node as the input texture. However, the advantage of using the FillMat node is that you can easily apply it to the alpha channel in addition to the rgb channels and it doesn't break the shading sequence, so you can insert it after other material nodes in your node tree.

## Inputs and Controls

| Connection Type | Connection Name | Function                                           |
|-----------------|-----------------|----------------------------------------------------|
| Input           | unnamed         | The 2D image you're using for the surface texture. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                    |
|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------|
| FillMat Tab  |                  |               |                                                                                                                             |
| channels     | channels         | rgba          | The effect is only applied to these channels.<br><br>You can use the checkboxes on the right to select individual channels. |
| color        | color            | 0             | Adjusts the color used as the constant to replace the material.                                                             |

# GeoSelect

The GeoSelect node allows you to select individual vertices on a 3D geometry object and save and restore your selections.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                    |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The 3D geometry object you want to select vertices on, for example, a Sphere or a Cube node. If you want to manipulate several objects together, you can also connect a MergeGeo node here. |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

# Light

You can use the Light node to add a direct, point, or spot light into your script rather than using specific predefined light nodes. The **light type** dropdown defines which light is created and enables or disables the relevant controls in the properties panel. The node can also import lights from **.fbx** files using the **File** tab.

See also [Spot](#), [Point](#), [Direct](#), [Environment](#), and [Relight](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | axis            | <p>An optional Axis node input. This links the position, rotation, scale, and skew of the transformed 3D object(s) to the Axis node, so that the transformation controls on the Axis node override the corresponding controls on the TransformGeo node.</p> <p>If you've worked with other 3D applications, you may know the Axis node as a "null" or "locator" object.</p> |
|                 | look            | <p>An optional input where you can connect a Camera, Light, or Axis that the Light is automatically rotated to point toward. The Light is automatically rotated to point towards the connected input whenever the <b>look</b> input is moved.</p>                                                                                                                           |

| Control (UI)        | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------|---------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Light Tab           |                     |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| read from file      | read_from_file      | disabled      | When disabled, the light is configured using the controls on the <b>Light</b> tab. Enable <b>read from file</b> if you want to read in light information from an .fbx file using the <b>File</b> tab.                                                                                                                                                                                                                                                                                     |
| light type          | light_type          | point         | Sets the light type to <b>point</b> , <b>directional</b> , or <b>spot</b> and disables irrelevant controls.                                                                                                                                                                                                                                                                                                                                                                               |
| color               | color               | 1             | Sets the color of the light.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| intensity           | intensity           | 1             | Sets the brightness of the light.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| cone angle          | cone_angle          | 40            | <p>Sets the spot light cone angle adjusting the spread of the light. Valid angles are from 0 to 180 degrees.</p> <div>  <b>Note:</b> This control is only enabled for <b>spot</b> lights. </div>                                                                                                                                                                                                         |
| cone penumbra angle | cone_penumbra_angle | 0             | <p>Controls spot light softness along the edge of the area of illumination. A negative value fades inward from the circle's edge and vice versa. The cone falloff should be set to zero or a low amount in order to see the softness.</p> <div>  <b>Note:</b> This control is only enabled for <b>spot</b> lights and does not affect the Viewer. Results are only visible on rendered objects. </div> |
| cone falloff        | cone_falloff        | 0             | <p>Sets how much the spot light diminishes from the center of the circular region out to the edge. The higher the value, the more focused the light. The falloff is independent of the falloff type</p> <div>  <b>Note:</b> This control is only enabled for <b>spot</b> lights and is not affected by <b>falloff type</b>. </div>                                                                     |

| Control (UI)                                                                        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| shadow mode   | shadow_mode      | solid         | <p>Presents three shadow casting modes that affect shadows cast by objects, based on the objects' opacity:</p> <ul style="list-style-type: none"> <li>• <b>solid</b> - objects that cast shadows are considered to be completely solid. This option can be used with both ScanlineRender and PrmanRender.</li> <li>• <b>clipped alpha</b> - objects that cast shadows are considered to be transparent if the object's alpha is below the light's clipping threshold control in the Shadows tab. This option is only relevant if you are using ScanlineRender to render your shadows.</li> <li>• <b>full alpha</b> - shadows are calculated based on how light is reduced when it passes through non-opaque occluders. This option is only relevant if you are using ScanlineRender to render your shadows.</li> </ul> |
| filter        | filter           | cubic         | Determines the type of filter that the <b>shadow mode</b> uses when it's set to <b>clipped alpha</b> or <b>full alpha</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| scene epsilon | scene_epsilon    | 0.001         | <p>An offset that moves the sampling point away from the geometry surface, towards the light that is casting the shadow. Increasing this value can reduce self-shadowing artifacts.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>full alpha</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| samples       | samples          | 1             | <p>Sets the number of samples for the light when generating soft shadows. If soft shadows in your scene appear dotty or noisy, try increasing this value. The higher the value, the smoother the soft the shadows become.</p> <p>This control is only relevant when <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| sample width  | sample_width     | 1             | Sets the size of the light for soft shadows. This value determines the width of the soft area around the edge of                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Control (UI)       | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|---------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    |                     |               | <p>a shadow. The higher the value, the larger the soft area.</p> <p>This control is only relevant if your shadows are generated using raytracing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| bias               | depthmap_bias       | 0.01          | <p>Sets the bias for the raytracing or shadow map. Increase this value if self shadowing artifacts appear in the image. This moves the surface sample point away from surface. Note, however, that if you increase the value too much, some shadows may start moving away from the base of the objects that cast them.</p> <p>This control is only relevant when <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p>                                                                                                                                                                                                                    |
| slope bias         | depthmap_slope_bias | 0.01          | <p>Bias for the shadow map. This is like <b>bias</b>, but the offset is proportional to the slope of the depth map. This allows you to give a different offset to each value in the depth map, depending on the surface's slope relative to the light.</p> <p>If increasing <b>bias</b> reduced the existing self-shadowing artifacts but introduced more artifacts in other areas of the image, you may want to bring <b>bias</b> down a little and increase <b>slope bias</b> instead.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p> |
| clipping threshold | clipping_threshold  | 0.5           | <p>Objects that are set to cast shadows are considered transparent if their alpha is below the value set here.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>clipped alpha</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                           |
| jitter scale       | shadow_jitter_scale | 3             | <p>Sets the amount of jitter used when doing percentage-closer filtering (PCF) for soft shadows. A larger <b>jitter scale</b> value results in softer, more perceptually accurate</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Control (UI)                                                                    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------------------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                 |                  |               | <p>shadows.</p> <p>PCF works by sampling the depth map at many different positions around the same spot. The final shadow value for that spot is an average of how many of the samples were occluded or visible from point of view of the light.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p>                             |
| depthmap resolution                                                             | depthmap_width   | 1024          | <p>Sets the resolution of the depth map. Larger values will result in a less crunchy edge, but will require more time to process.</p> <p>Note that you can also fix crunchy edges by increasing the number of <b>samples</b> instead of increasing the depth map resolution.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p> |
| output mask                                                                     | shadow_mask      | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                       |
|                                                                                 |                  | none          | Sets the channel you want to output the shadow map into. This can be enabled even if the <b>cast shadows</b> box is disabled.                                                                                                                                                                                                                                                                                                                  |
| File Tab (Controls on this tab are only active when read from file is enabled.) |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| read from file                                                                  | read_from_file   | disabled      | When disabled, the light is configured using the controls on the <b>Light</b> tab. Enable <b>read from file</b> if you want to read in light information from an .fbx file using the <b>File</b> tab.                                                                                                                                                                                                                                          |
| file                                                                            | file             | N/A           | Sets the file path for the .fbx file from which you intend to import axis information.                                                                                                                                                                                                                                                                                                                                                         |

| rotate X             | look_rotate_x    | enabled       | Determines whether the rotation occurs around the X axis. Note that for the rotation to truly "look at" the <b>look</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Control (UI)    | Knob (Scripting)     | Default Value | Function                                                                                                                                                                   |
|-----------------|----------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                      |               | input, all three of these options must be activated.                                                                                                                       |
| rotate Y        | look_rotate_y        | enabled       | Determines whether the rotation occurs around the Y axis. Note that for the rotation to truly "look at" the <b>look</b> input, you have to set all three of these options. |
| rotate Z        | look_rotate_z        | enabled       | Determines whether the rotation occurs around the Z axis. Note that for the rotation to truly "look at" the <b>look</b> input, you have to set all three of these options. |
| look strength   | look_strength        | 1             | Determines to what extent the Light rotates to the new orientation. The smaller the value, the less the object is rotated. Setting the value to 0 produces no rotation.    |
| use quaternions | look_use_quaternions | disabled      | Uses an alternate scheme to calculate the <b>look</b> rotation. This option may be useful to smooth out erratic rotations along the look axis.                             |

# LogGeo

Move the XYZ of the points by raising the values to a power. This can be useful if you need to visualize rgb values as a point cloud by treating the rgb values as xyz positions.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                    |

|              |                  |               | <p>In the above, <math>v_x</math> refers to the x coordinate of vertex v and <math>\log_x</math> refers to the x value entered into the <b>log</b> field. When <b>swap</b> is checked, the values are calculated like this:</p> $v_x = \log_x^v - 1.0$ $v_y = \log_y^v - 1.0$ $v_z = \log_z^v - 1.0$ |
| clamp black  | clamp_black      | disabled      | To clamp the negative x, y, and z values to 0.0, check clamp black. This prevents your calculated values from continuing to infinity. This option is only valid if you have checked <b>swap</b> .                                                                                                    |

# LookupGeo

The LookupGeo node lets you use lookup curves to modify the shape of your 3D geometry objects. It offers you direct global control over each of the vertex x, y, and z values respectively. You can, for example, only modify all the y values without touching the x and z values.

You change the different vertex values (x, y, or z) by modifying their associated 2D curves in lookup tables (LUTs). The x axis in the LUT represents the current vertex value, and the y axis the new vertex value. By default, the curve is a diagonal line where all the points in the curve have the same value on the y axis (the new value) as they do on the x axis (the current value). Because both x and y values are the same, there is no change in the object's shape.

| LUT curves    | lut              | N/A           | <p>Selects the curve you want to modify. Choose <b>X</b>, <b>Y</b> or <b>Z</b>. For example, you'd select Z to only modify the vertex z values.</p> <p>Adjust the curve as necessary by dragging. To insert points on the curve, <b>Ctrl/Cmd+Alt</b>+click on the curve.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| reset         | N/A              | N/A           | Resets the selected curve(s) to their initial values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

# MergeGeo

Merges your 3D geometry objects together into one big geometry so you can process all of them at the same time.

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | numbered inputs | Any 3D geometry objects you want to merge together. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|----------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| render         | render_mode      | unchanged     | Sets how the merged objects will render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                               |
| shadow         | shadow_override  | unchanged     | Determines whether merged geometry nodes remain <b>unchanged</b> , or are adjusted to <b>override inputs</b> . If the latter option is chosen, you can set shadow options for the newly merged nodes.            |
| cast shadow    | cast_shadow      | disabled      | If the shadow operation is set to <b>override inputs</b> , <b>cast shadow</b> enables the geometry to cast shadows on other objects.                                                                             |
| receive shadow | receive_shadow   | disabled      | If the shadows operation is set to <b>override inputs</b> , <b>receive shadow</b> enables the geometry to have shadows cast on it by other objects, provided a materials shader has been attached to the object. |

# MergeMat

Combine two shader nodes together, using compositing algorithms like **none**, **replace**, **over**, and **stencil**. The MergeMat node is particularly useful for combining multiple Project3D nodes, allowing you to composite 2D images projected onto the 3D geometry atop each other.

## Inputs and Controls

| Connection Type | Connection Name | Function                                      |
|-----------------|-----------------|-----------------------------------------------|
| Input           | A               | The the foreground material element to merge. |
|                 | B               | The the background material element to merge. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MergeMat Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| channels     | channels         | rgba          | <p>The effect is only applied to these channels.</p> <p>You can use the checkboxes on the right to select individual channels.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| operation    | operation        | over          | <p>Selects how you want to composite the results of the two shader nodes together:</p> <ul style="list-style-type: none"> <li>• <b>none</b> - only use input B in the composite.</li> <li>• <b>replace</b> - only use input A in the composite.</li> <li>• <b>over</b> - composite input A over input B using a mask.</li> <li>• <b>stencil</b> - use input B outside the mask area.</li> <li>• <b>mask</b> - use input B inside the mask area.</li> <li>• <b>plus</b> - add input B to input A.</li> <li>• <b>max</b> - use input A if it is greater than input B, otherwise use input B.</li> <li>• <b>min</b> - use input A if it is less than input B, otherwise use input B.</li> </ul> |

# ModelBuilder

The ModelBuilder node (NukeX and Nuke Studio only) provides an easy way to create 3D models for 2D shots. You can build a model by creating shapes and then editing them, and align models over your 2D footage by dragging vertices to their corresponding 2D location.

To be able to align models, ModelBuilder needs a tracked camera and an input image for visual reference. You can also use other 3D geometry and point clouds as a reference if you already have these for your scene.

If you don't connect a camera, image sequence, or reference geometry, you can still create and edit 3D models, you just can't do anything in Align mode.

Creating and editing models using ModelBuilder requires a NukeX license, but the resulting geometry can also be used in Nuke.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | geo             | <p>3D geometry to use as a reference when positioning new shapes.</p> <p>For example, you can use the <a href="#">PointCloudGenerator</a> node to create a 3D point cloud for your shot, and connect that to this input. When creating new shapes, you can then select vertices on the point cloud to automatically align the shapes with the point cloud. This gives you an approximate initial position for your shapes.</p> |
|                 | cam             | The camera track of the scene in which you intend to use the ModelBuilder.                                                                                                                                                                                                                                                                                                                                                     |
|                 | src             | The source footage from which the camera information was obtained.                                                                                                                                                                                                                                                                                                                                                             |
|                 | tex             | An optional 2D texture that you can display as a background in the UV preview window and on the model in the 3D Viewer.                                                                                                                                                                                                                                                                                                        |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ModelBuilder Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| display          | display          | wireframe     | <p>Adjusts the display characteristics of the 3D shapes. These settings don't affect the render output of the scene; these are for display purposes only in the 3D Viewer.</p> <ul style="list-style-type: none"> <li>• <b>off</b> - hides the 3D shape.</li> <li>• <b>wireframe</b> - displays only the outlines of the shape's geometry.</li> <li>• <b>solid</b> - displays all geometry with a solid color.</li> <li>• <b>solid+wireframe</b> - displays the geometry as solid color with the shape's geometry outlines.</li> <li>• <b>textured</b> - displays only the surface texture.</li> <li>• <b>textured+wireframe</b> - displays the wireframe plus the surface texture.</li> </ul> |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                               |
|----------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| selectable     | selectable       | enabled       | When enabled, you can make selections as normal in the Viewer. When disabled, points cannot be selected or changed.                                                                                                                                                                                                                                                    |
| render         | render_mode      | textured      | Sets how the object will render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                                                                                                                                                                                             |
| cast shadow    | cast_shadow      | enabled       | When enabled, the shape(s) can cast shadows.                                                                                                                                                                                                                                                                                                                           |
| receive shadow | receive_shadow   | enabled       | When enabled, and the geometry has a material shader attached to it, the shape(s) can receive shadows.                                                                                                                                                                                                                                                                 |
| Scene          | N/A              | N/A           | Shows the hierarchy of shapes and groups of shapes in the scene.<br><br>To rename shapes or groups, click on them and enter a new name.<br><br>To toggle the visibility of shapes or groups, click  . Note that when an item is hidden, it doesn't appear in the Viewer or renders. |

# ModifyRIB

The ModifyRIB node (NukeX only) lets you insert RIB (RenderMan Interface Bytestream) statements into your script to modify a RenderMan bytestream before it's passed to the PrmanRender node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                    |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The object or scene that you want to modify. Depending on the type of operation you choose, you may place the ModifyRIB node before or after the Scene node in your script. |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                               |
|---------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ModifyRIB Tab |                  |               |                                                                                                                                                                                                                                                                                                                                        |
| operation     | operation        | object        | Sets how RIB statements are modified in the RIB stream. You can choose from the following operations: <ul style="list-style-type: none"> <li>• <b>object</b> - RIB statements are inserted before the statements for the object connected to the input.</li> <li>• <b>shader</b> - RIB statements replace all of the shader</li> </ul> |

| Control (UI)                                                                        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|              |                  |               | you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                       |
| matrix       | matrix           | N/A           | <p>The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p> |

# Normals

The Normals node lets you manipulate the normals of your 3D geometry object. Object normals are vectors that are perpendicular to the surface. They are used in lighting calculations to determine how the light should bounce off a surface at any particular point. By manipulating them, you can control the diffuse and specular light contributions.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                    |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The 3D geometry object whose normals you want to manipulate. If you want to manipulate several objects together, you can also connect a MergeGeo node here. |
|                 | lookat          | Any Camera, Axis, or light node. If you set <b>action</b> to <b>lookat</b> , the node points all normals towards this input. (optional)                     |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Normals Tab  |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| display      | display          | unchanged     | <p>Adjusts the display characteristics of the 3D object. These settings don't affect the render output of the scene; these are for display purposes only in the 3D Viewer.</p> <ul style="list-style-type: none"> <li>• <b>off</b> - doesn't display geometry outlines.</li> <li>• <b>wireframe</b> - displays only the outlines of the object's geometry.</li> <li>• <b>solid</b> - displays all geometry with a solid color.</li> <li>• <b>solid + wireframe</b> - displays the geometry as solid color with the object's geometry outlines.</li> <li>• <b>textured</b> - displays only the surface texture.</li> <li>• <b>textured + wireframe</b> - displays the wireframe plus the surface texture.</li> <li>• <b>unchanged</b> - doesn't change the object's display mode. The Viewer can override this setting.</li> </ul> |
| selectable   | selectable       | enabled       | <p>When enabled, you can make selections as normal in the Viewer. When disabled, points cannot be selected or changed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| render       | render_mode      | unchanged     | <p>Sets how the object will render. This control is independent from the <b>display</b> selection, but has the same settings.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| action       | action           | unchanged     | <p>Sets the mode for manipulating normals:</p> <ul style="list-style-type: none"> <li>• <b>unchanged</b> - makes no changes to the object's normals.</li> <li>• <b>set</b> - assigns the normals' values to the normal <b>x</b>, <b>y</b>, and <b>z</b> fields.</li> <li>• <b>build</b> - rebuilds each normal based on the surrounding vertices. Adjust the <b>thresholdangle</b> slider to determine the break angle where two faces no longer constitute a smooth surface. An angle of 0 means all faces are flat, whereas 180 means all faces are smooth. A good average setting is 60.</li> <li>• <b>lookat</b> - points all normals at the object connected to</li> </ul>                                                                                                                                                   |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                  |               | <p>the <b>lookat</b> input. The <b>normal</b> control's values are added to the lookat position.</p> <ul style="list-style-type: none"> <li>• <b>delete</b> - removes the named attribute from the object. For example, if you remove the N attribute, the object has no normals. See the <b>attribname</b> control below.</li> </ul>                                                                                                                                                                                                                                        |
| invert          | invert           | disabled      | Inverts the resulting normals. This works in all action modes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| normal          | normal           | N/A           | Constant x, y, and z values. These are used in the <b>set</b> and <b>lookataction</b> modes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| angle threshold | threshold        | 45            | If the angle between two faces is greater than this, break the normal. This only works with vertex normals and is only available if <b>build</b> is selected in the <b>action</b> dropdown. Broken normals create sharp edges when lit.                                                                                                                                                                                                                                                                                                                                      |
| attrib name     | N_attrib_name    | N             | <p>The name of the normal attribute to delete (this only works if you set <b>action</b> to <b>delete</b>). Normals are stored as a named attribute of a piece of geometry. By default the attribute name is "N". With this control, you can tell the node to perform the delete action on normals from another attribute instead.</p> <ul style="list-style-type: none"> <li>• <b>Cf</b> - surface color</li> <li>• <b>N</b> - normal</li> <li>• <b>PW</b> - world-space point</li> <li>• <b>uv</b> - texture coordinates</li> <li>• <b>vel</b> - point velocity.</li> </ul> |

# Phong

Uses the Phong shading algorithm to provide accurate shading and highlights. The Phong node has several map inputs you can use to mask the effect of the node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                              |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | mapsh           | An optional mask for varying the shininess value. Where the mask is black, the shininess is set to <b>min shininess</b> . Where the mask is white, the shininess is set to <b>max shininess</b> . Values in between (where the matte is gray) are attenuated accordingly.             |
|                 | mapS            | An optional mask for limiting the effect of the specular component. Any changes you make to <b>specular</b> are limited to the non-black areas of the mask.                                                                                                                           |
|                 | mapE            | An optional mask for limiting the effect of the emissive component. Any changes you make to <b>emission</b> are limited to the non-black areas of the mask.                                                                                                                           |
|                 | mapD            | An optional mask for limiting the effect of the diffuse component. Any changes you make to <b>diffuse</b> are limited to the non-black areas of the mask.                                                                                                                             |
|                 | unnamed         | Either: <ul style="list-style-type: none"> <li>• The 2D image you're using for the surface texture, or</li> <li>• Another shader node, such as Diffuse, Specular, or Emission. Adding several shader nodes one after the other allows you to produce more complex effects.</li> </ul> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                          |
|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phong Tab    |                  |               |                                                                                                                                                                                   |
| channels     | channels         | rgba          | The effect is only applied to these channels.<br><br>If you set this to something other than <b>none</b> , you can use the checkboxes on the right to select individual channels. |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| color         | color            | 1             | Adjusts the material color.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| emission      | emission         | 0             | The color of the light the material emits. Note that when you have an image connected to the unnamed input of the node and adjust this value, you need to look at the rendered 2D image to see the effect of your changes. Changing the emission value does not have any effect in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                            |
| diffuse       | diffuse          | 0.18          | The color of the material when illuminated. Note that when you have an image connected to the unnamed input of the node and adjust this value, you need to look at the rendered 2D image to see the effect of your changes. Changing the white value does not have any effect in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                              |
| specular      | specular         | 0.8           | Adjusts how bright the highlights on the material seem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| min shininess | min_shininess    | 10            | <p>The shininess value controls the width of the highlights. The higher the value, the wider the highlights.</p> <p>If you have connected a mask to the <b>mapSh</b> input of the node, pixel values in the mask are used to vary the shininess value. Where the matte is black, the shininess is set to <b>min shininess</b>. Where the matte is white, the shininess is set to <b>max shininess</b>. # Point

A Point light is a point in 3D space that emits light in every direction. A real world example of a point light is a light bulb. You can use Point lights to simulate light bulbs, lamps, and candles, for example.

See also [Light](#), [Spot](#), [Direct](#), [Environment](#), and [Relight](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                  |
|-----------------|-----------------|-------------------------------------------|
| Input           | unnamed         | An Axis, a Camera, or another Light node. |

| Control (UI)                                                                        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|               |                  |               | <p>completely solid. This option can be used with both ScanlineRender and PrmanRender.</p> <ul style="list-style-type: none"> <li>• <b>clipped alpha</b> - objects that cast shadows are considered to be transparent if the object's alpha is below the light's clipping threshold control in the Shadows tab. This option is only relevant if you are using ScanlineRender to render your shadows.</li> <li>• <b>full alpha</b> - shadows are calculated based on how light is reduced when it passes through non-opaque occluders. This option is only relevant if you are using ScanlineRender to render your shadows.</li> </ul> |
| filter        | filter           | cubic         | Determines the type of filter that the <b>shadow mode</b> uses when it's set to <b>clipped alpha</b> or <b>full alpha</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| scene epsilon | scene_epsilon    | 0.001         | <p>An offset that moves the sampling point away from the geometry surface, towards the light that is casting the shadow. Increasing this value can reduce self-shadowing artifacts.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>full alpha</b>.</p>                                                                                                                                                                                                                                                                                                    |
| samples       | samples          | 1             | <p>Sets the number of samples for the light when generating soft shadows. If soft shadows in your scene appear dotty or noisy, try increasing this value. The higher the value, the smoother the soft the shadows become.</p> <p>This control is only relevant when <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p>                                                                                                                                                                                                                                                                                            |
| sample width  | sample_width     | 1             | <p>Sets the size of the light for soft shadows. This value determines the width of the soft area around the edge of a shadow. The higher the value, the larger the soft area.</p> <p>This control is only relevant if your shadows are generated using raytracing.</p>                                                                                                                                                                                                                                                                                                                                                                |

| Control (UI)       | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|---------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bias               | depthmap_bias       | 0.01          | <p>Sets the bias for the raytracing or shadow map. Increase this value if self shadowing artifacts appear in the image. This moves the surface sample point away from surface. Note, however, that if you increase the value too much, some shadows may start moving away from the base of the objects that cast them.</p> <p>This control is only relevant when <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p>                                                                                                                                                                                                                    |
| slope bias         | depthmap_slope_bias | 0.01          | <p>Bias for the shadow map. This is like <b>bias</b>, but the offset is proportional to the slope of the depth map. This allows you to give a different offset to each value in the depth map, depending on the surface's slope relative to the light.</p> <p>If increasing <b>bias</b> reduced the existing self-shadowing artifacts but introduced more artifacts in other areas of the image, you may want to bring <b>bias</b> down a little and increase <b>slope bias</b> instead.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p> |
| clipping threshold | clipping_threshold  | 0.5           | <p>Objects that are set to cast shadows are considered transparent if their alpha is below the value set here.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>clipped alpha</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                           |
| jitter scale       | shadow_jitter_scale | 3             | <p>Sets the amount of jitter used when doing percentage-closer filtering (PCF) for soft shadows. A larger <b>jitter scale</b> value results in softer, more perceptually accurate shadows.</p> <p>PCF works by sampling the depth map at many different positions around the same spot. The final shadow value</p>                                                                                                                                                                                                                                                                                                                                         |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     |                  |               | <p>for that spot is an average of how many of the samples were occluded or visible from point of view of the light.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p>                                                                                                                                                          |
| depthmap resolution | depthmap_width   | 1024          | <p>Sets the resolution of the depth map. Larger values will result in a less crunchy edge, but will require more time to process.</p> <p>Note that you can also fix crunchy edges by increasing the number of <b>samples</b> instead of increasing the depth map resolution.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p> |
| output mask         | shadow_mask      | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                       |
|                     |                  | none          | Sets the channel you want to output the shadow map into. This can be enabled even if the <b>cast shadows</b> box is disabled.                                                                                                                                                                                                                                                                                                                  |

# PointCloudGenerator

Using the PointCloudGenerator node (NukeX and Nuke Studio only) you can create a dense point cloud based on the information generated by [CameraTracker](#) and use the dense point cloud further to create 3D meshes of your 2D footage. Dense point clouds are a useful starting point for 3D modeling and positioning objects in a scene.

**Note:** The analysis must be performed in NukeX, but the result can be used in Nuke.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | Camera          | The camera track of the scene from which you intend to generate the dense point cloud.                                                                                                                                                                                                                                                                                       |
|                 | Mask            | <p>An optional image to use as a mask. By default, the point cloud is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |
|                 | Source          | The source footage from which the camera information was obtained.                                                                                                                                                                                                                                                                                                           |

| Control (UI)            | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Analyze        | analyzeSequence  | N/A           | Click to automatically analyse the sequence and set                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                               |
|---------------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sequence            |                  |               | <p>the required keyframes to use when generating the point cloud.</p> <div>  <b>Note:</b> Keyframes are selected to provide a large enough camera baseline to triangulate points, but you can add and delete keyframes manually, if necessary. </div> |
| Keyframes           | keyframes        | 0             | Displays the frames used to track points in the input sequence. Both automatic and manual keyframes are shown.                                                                                                                                                                                                                         |
| Add                 | addKeyframe      | N/A           | Click to set a keyframe at the current frame.                                                                                                                                                                                                                                                                                          |
| Delete              | deleteKeyframe   | N/A           | Click to delete the keyframe at the current frame.                                                                                                                                                                                                                                                                                     |
| Frame Spacing       | frameSpacing     | 15            | Sets the interval between keyframes when you click <b>Add All</b> . For example, the default value creates a keyframe every 15th frame.                                                                                                                                                                                                |
| Add All             | addAllKeyframes  | N/A           | Click to set keyframes throughout the sequence at intervals specified by the <b>FrameSpacing</b> control. For example, for a sequence with 30 frames, the default spacing value creates 3 keyframes.                                                                                                                                   |
| Delete All          | deleteKeyframes  | N/A           | Click to delete all keyframes in the sequence.                                                                                                                                                                                                                                                                                         |
| Calculated Accuracy | accuracy         | 0             | <p>Displays the depth accuracy calculated at the current frame when using the automatic <b>SetKeyframes</b> method.</p> <p>The accuracy rating can help you to select frame ranges when generating a point cloud - higher accuracy frames produce cleaner point clouds.</p>                                                            |
| Dense Tracking      |                  |               |                                                                                                                                                                                                                                                                                                                                        |
| Point Separation    | pointSeparation  | 2             | Sets the separation value, in pixels, for points in the dense point cloud. Reduce the separation to create denser point clouds and vice-versa.                                                                                                                                                                                         |

| Control (UI)            | Knob (Scripting)      | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|-----------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Track Threshold         | matchThreshold        | 0.5           | Sets the correlation threshold at which point tracks are terminated. Use a higher threshold to increase the accuracy in matching points between keyframes.                                                                                                                                                                                                               |
| Track Points            | track                 | N/A           | <p>Click to display a frame range dialog to determine which frames are used to calculate the point cloud. Use the standard Nuke notation, for example, 1-19, 40-60, 65-100.</p> <p>Points can also be added to the point cloud in stages using different frame range selections. Use <b>CalculatedAccuracy</b> to determine the most accurate frames for generation.</p> |
| Clear Points            | clearPoints           | N/A           | Click to clear all tracked points.                                                                                                                                                                                                                                                                                                                                       |
| Post Filtering          |                       |               |                                                                                                                                                                                                                                                                                                                                                                          |
| Display rejected points | displayRejectedPoints | enabled       | <p>When enabled, points that fall outside the <b>Angle</b> and <b>DensityThresholds</b> are highlighted in the 3D Viewer.</p> <p>When disabled, all rejected points are removed from the Viewer.</p>                                                                                                                                                                     |
| Angle Threshold         | minTriAngle           | 1             | <p>Sets the threshold for the minimum angle to triangulate 3D points (in degrees). Points with a large triangulation angle are more accurate. Set a threshold of 0 to triangulate all points. Increase the threshold to retain the more accurate points.</p> <p>As a rule of thumb, anything below 5 degrees is likely to be incorrect.</p>                              |
| Density Threshold       | densityThreshold      | 0             | Sets the threshold for the minimum density for points. Set a threshold of 0 to output all points and increase the threshold to highlight isolated points.                                                                                                                                                                                                                |
| Delete Rejected Points  | deleteRejected        | N/A           | Click to permanently delete points that are rejected by the <b>Angle</b> and <b>DensityThresholds</b> .                                                                                                                                                                                                                                                                  |

| Control (UI)               | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                             |
|----------------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                            |                  |               |  <b>Tip:</b> To clean up the point cloud, try enabling <b>Output points per frame</b> and <b>Display rejected points</b> . You can then tune the <b>Filtering</b> thresholds and delete points at different frames. |
| Output                     |                  |               |                                                                                                                                                                                                                                                                                                      |
| Point Size                 | pointSize        | 2             | Sets the size, in pixels, of points displayed in the 3D Viewer.                                                                                                                                                                                                                                      |

# PoissonMesh

The PoissonMesh node (NukeX and Nuke Studio only) uses information from a dense point cloud to generate a mesh that you can further use as a 3D object, in 3D modeling for instance. The PoissonMesh node is based on the Poisson Surface Reconstruction calculation method. The original source code and paper were created by Michael Kazhdan, Matthew Bolitho, and Hugues Hoppe (for more information, see <http://www.cs.jhu.edu/~misha/Code/PoissonRecon/>).

See also [PointCloudGenerator](#) and [ModelBuilder](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                 |
|-----------------|-----------------|----------------------------------------------------------|
| Input           | unnamed         | The PointCloudGenerator node on which the mesh is based. |

| Control (UI)    | Knob (Scripting) | Default Value | Function |
|-----------------|------------------|---------------|----------|
| PoissonMesh Tab |                  |               |          |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Use Selection | useSelection     | enabled       | When enabled, selection flags from GeoSelect nodes further up the tree are used to create the mesh.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Filtering     | useFiltering     | enabled       | When enabled, only faces with normals similar to those of the input are created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Depth         | depth            | 8             | <p>Sets the maximum depth of the calculation tree that is used for surface reconstruction.</p> <p>You can also think of it as the density of the voxels (volumetric pixel) used by the solver. Running at depth <b>d</b> corresponds to solving on a voxel grid whose resolution is no larger than <math>2^d \times 2^d \times 2^d</math>. Note that since the reconstructor dynamically adapts the octree, the specified reconstruction depth is only an upper bound.</p> <div>  <p><b>Note:</b> Each increment increases the solver's potential memory usage by 8 times, so keep it as low as possible. Due to the scaling of memory requirements with each increment, the maximum value is 10.</p> </div> |
| Scale         | scale            | 1.25          | Sets the floating point ratio between the 3D cube used to create the mesh and the bounding box of the footage it's created from.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Solver Divide | solverDivide     | 8             | Sets the depth at which the solver equation is used in the creation of your mesh. Using this parameter can help reduce the memory overhead at the cost of a small increase in reconstruction time. For example, with a reconstruction <b>Depth</b> of 9 or higher, a subdivide depth of 7 or 8 can reduce the memory usage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Iso Divide    | isoDivide        | 8             | Sets the depth at which the iso-surface extractor is used in extraction. This can help you reduce your memory usage when generating complex meshes. For example, with a reconstruction <b>Depth</b> of 9 or higher, a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                            |
|------------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  |                  |               | subdivide depth of 7 or 8 can reduce the memory usage.                                                                                                                                                                                                                                                                                              |
| Samples per Node | samplesPerNode   | 1             | Sets the minimum number of sample points used to create your mesh. <ul style="list-style-type: none"> <li>• For noise-free samples, small values in the range [1.0 - 5.0] are acceptable.</li> <li>• For more noisy samples, larger values in the range [15.0 - 20.0] may be needed to provide a smoother, noise-reduced reconstruction.</li> </ul> |
| Confidence       | confidence       | disabled      | When enabled, the size of the normals is used as confidence information when generating the mesh. This may take longer, but can give you better results - your point cloud point creation is double-checked.                                                                                                                                        |

# PositionToPoints

Generates a 3D point cloud from an xyz image, such as a position pass. If all the data is in multiple channels in the input image, then set the **surface point** to the channels that contain the xyz data in the input image, and optionally set the **surface normal** to the channels with the point normals. If you have the xyz and normals in separate image streams, you can instead connect the xyz stream to the **pos** input and optionally connect the normals to the **norm** input.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                             |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image from which the point cloud is generated, if all xyz data resides in one image. This is also where the color information for the point cloud is taken from. |

| Connection Type | Connection Name | Function                                                                                                   |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------|
|                 | pos             | The image containing positional data. Note that this input is hidden until the unnamed input is connected. |
|                 | norm            | The image containing normals data. Note that this input is hidden until the <b>pos</b> input is connected. |

| Control (UI)         | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PositionToPoints Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| display              | display          | solid         | <p>Adjusts the display characteristics of 3D objects. These settings don't affect the render output of the scene; these are for display purposes only in the 3D Viewer.</p> <ul style="list-style-type: none"> <li>• <b>off</b> - hides the 3D geometry object.</li> <li>• <b>wireframe</b> - displays only the outlines of the object's geometry.</li> <li>• <b>solid</b> - displays all geometry with a solid color.</li> <li>• <b>solid+wireframe</b> - displays the geometry as solid color with the object's geometry outlines.</li> <li>• <b>textured</b> - displays only the surface texture.</li> <li>• <b>textured+wireframe</b> - displays the wireframe plus the surface texture.</li> </ul> |
| selectable           | selectable       | enabled       | When enabled, you can make selections as normal in the Viewer. When disabled, points cannot be selected or changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| render               | render_mode      | solid         | Sets how the points will render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| cast shadow          | cast_shadow      | enabled       | When enabled, the object can cast shadows.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| receive shadow       | receive_shadow   | enabled       | When enabled, and a material shader is added to the object, the object can receive shadows.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| frame range          | frame_first      | 1             | Sets the start frame for the frame range displayed in the Viewer when the Timeline range is set to <b>Input</b> . This can                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                            |
|----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |               | be used to display the offset used in the TimeOffset node.                                                                                                                          |
|                | frame_last       | 1             | Sets the end frame for the frame range displayed in the Viewer when the Timeline range is set to <b>Input</b> . This can be used to display the offset used in the TimeOffset node. |
| surface point  | P_channel        | none          | The point positions are taken from these channels in the first input. If the <b>pos</b> input is used these channels are ignored.                                                   |
| surface normal | N_channel        | none          | The point normals are taken from these channels in the first input. If the <b>norm</b> input is used these channels are ignored.                                                    |
| point detail   | detail           | 0.5           | Controls the number of available points to display in the Viewer. A value of 0 means no points are displayed. A value of 1 displays all available points.                           |
| point size     | pointSize        | 5             | Controls the display size of the points in the Viewer.                                                                                                                              |

# PrmanRender

PrmanRender (NukeX and Nuke Studio only) is a render node that works together with Pixar's PhotoRealistic RenderMan® Pro Server 20, or earlier, to give you an even better quality render result. PrmanRender is an alternative to Nuke's [ScanlineRender](#) with additional features for rendering 3D scenes. With PrmanRender, you have control over aspects like shadows and reflections in your render result.

In order to use the PrmanRender node, you need to have Pixar's RenderMan Pro Server 20, or earlier, installed and licensed on your machine.

See also [ScanlineRender](#), [Reflection](#), and [Refraction](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                    |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | cam             | An optional camera input. The scene is rendered from the perspective of this camera. If the camera input is not connected, PrmanRender uses a default camera positioned at the origin and facing in the negative Z direction.                               |
|                 | obj/scn         | Either: <ul style="list-style-type: none"> <li>• A Scene node that is connected to the objects and lights you want to render, or</li> <li>• a 3D object or MergeGeo node.</li> </ul>                                                                        |
|                 | bg              | An optional background input. This can be used to composite a background image into the scene and to determine the output resolution. If not used, this defaults to <b>root.format</b> or <b>root.proxy_format</b> defined in the <b>Project Settings</b> . |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                              |
|-----------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PrmanRender Tab |                  |               |                                                                                                                                                                       |
| shadows         | shadows          | disabled      | When enabled, add shadows to your render. You can adjust the parameters for your shadows using the <a href="#">Light</a> node's <b>Shadows</b> tab.                   |
| reflections     | reflections      | disabled      | When enabled, add reflections to your render. You can adjust the parameters for your reflections using the <a href="#">Reflection</a> node's <b>Properties</b> panel. |
| refractions     | refractions      | disabled      | When enabled, add refractions to your render. You can adjust the parameters for your refractions using the <a href="#">Refraction</a> node's <b>Properties</b> panel. |
| dof             | dof              | disabled      | When enabled, add depth of field to your render.                                                                                                                      |
| projection mode | projection_mode  | render camera | Sets the projection mode during render:                                                                                                                               |

| Control (UI)       | Knob (Scripting)   | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|--------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    |                    |               | <ul style="list-style-type: none"> <li>• <b>perspective</b> - objects in front of the camera have the illusion of depth defined by the camera's focal-length and aperture.</li> <li>• <b>orthographic</b> - objects are viewed using parallel projection.</li> <li>• <b>render camera</b> - take the projection mode from the camera input.</li> </ul>                                                                                                                              |
| overscan           | overscan           | 0             | Sets the number of pixels to render beyond the left/right and top/bottom of frame, if requested by subsequent operations.                                                                                                                                                                                                                                                                                                                                                           |
| ambient            | ambient            | 0             | Sets the global ambient light level.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Sampling Tab       |                    |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| raytrace max depth | raytrace_max_depth | 5             | Sets the maximum number of specular reflection and refraction bounces PrmanRender uses to trace your scene and make render calculations.                                                                                                                                                                                                                                                                                                                                            |
| pixel samples      | pixel_samples      | 10            | <p>Sets the number of samples to render per pixel. Having more samples increases your render quality, but also increases render time.</p> <div>  <b>Note:</b> Setting this value to 1 turns antialiasing off.         </div>                                                                                                                                                                     |
| shading rate       | shading_rate       | 0.5           | <p>Sets the number of shading calculations for primitives. For example, a shading rate of 1.0 specifies one shading sample per pixel.</p> <p>This value, along with <b>pixel samples</b>, directly affects your rendering time and the final quality of your results. A low shading rate value means your render will take more time, but the quality will be very high. A high value on the other hand means your render is faster, but the final quality will not be as good.</p> |

| Control (UI)        | Knob (Scripting)         | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| filter              | filter                   | Cubic         | <p>Select the filtering algorithm to use when remapping pixels from their original positions to new positions. This allows you to avoid problems with image quality, particularly in high contrast areas of the frame (where highly aliased, or jaggy, edges may appear if pixels are not filtered and retain their original values).</p> <ul style="list-style-type: none"> <li>• <b>Impulse</b> - remapped pixels carry their original values.</li> <li>• <b>Cubic</b> - remapped pixels receive some smoothing.</li> <li>• <b>Keys</b> - remapped pixels receive some smoothing, plus minor sharpening (as shown by the negative -y portions of the curve).</li> <li>• <b>Simon</b> - remapped pixels receive some smoothing, plus medium sharpening (as shown by the negative -y portions of the curve).</li> <li>• <b>Rifman</b> - remapped pixels receive some smoothing, plus significant sharpening (as shown by the negative -y portions of the curve).</li> <li>• <b>Mitchell</b> - remapped pixels receive some smoothing, plus blurring to hide pixelation.</li> <li>• <b>Parzen</b> - remapped pixels receive the greatest smoothing of all filters.</li> <li>• <b>Notch</b> - remapped pixels receive flat smoothing (which tends to hide moire patterns).</li> <li>• <b>Lanczos4</b>, <b>Lanczos6</b>, and <b>Sinc4</b> - remapped pixels receive sharpening which can be useful for scaling down. <b>Lanczos4</b> provides the least sharpening and <b>Sinc4</b> the most.</li> </ul> |
| antialiasing filter | antialiasing_filter      | Box           | Sets the antialiasing method used to filter the pixel samples into the final color.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| antialiasing        | antialiasing_filter_size | 1             | Sets the size of the antialiasing pixel filter to be                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| filter size         |                  |               | used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| motion blur samples | samples          | 1             | <p>Sets the number of samples to render, per pixel, to produce motion blur. The maximum is 5.</p> <p>This determines the number of samples of the 3D scene used so as low a value as possible is best for setup speed and memory use. If the motion in the scene over the shutter period is relatively linear, lower values can be used. If the motion is complex, then values toward the higher end of the range may be required.</p> <p>If the rendered result shows banding or stepping that looks like too few motion blur samples, first try increasing the 'pixel samples' setting.</p>                                                                                                                                                                                                                  |
| shutter             | shutter          | 0.5           | Sets the number of frames the shutter stays open when motion blurring. For example, a value of 0.5 corresponds to half a frame.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| shutter offset      | shutteroffset    | start         | <p>This value controls how the shutter behaves with respect to the current frame value. It has four options:</p> <ul style="list-style-type: none"> <li>• <b>centred</b> - center the shutter around the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29,5 to 30,5.</li> <li>• <b>start</b> - open the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 30 to 31.</li> <li>• <b>end</b> - close the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29 to 30.</li> <li>• <b>custom</b> - open the shutter at the time you</li> </ul> |

| Control (UI)           | Knob (Scripting)           | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------|----------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                        |                            |               | specify. In the field next to the dropdown menu, enter a value (in frames) you want to add to the current frame. To open the shutter before the current frame, enter a negative value. For example, a value of - 0.5 would open the shutter half a frame before the current frame.                                                                                                         |
| shuttercustom offset   | shuttercustomoffset        | 0             | If the <b>shutter offset</b> parameter is set to <b>custom</b> , this parameter is used to set the time that the shutter opens by adding it to the current frame. Values are in frames, so -0.5 would open the shutter half a frame before the current frame.                                                                                                                              |
| randomize time         | temporal_jitter            | 0             | Adds randomness to the distribution of samples in time so they don't produce regularly spaced images. The larger the value, the larger the time difference between the samples.                                                                                                                                                                                                            |
| shutter opening        | shutter_opening            | None          | Sets the shutter opening mode: <ul style="list-style-type: none"> <li>• <b>None</b> - instantaneous open and close.</li> <li>• <b>Linear</b> - the shutter opens and closes in linear intervals.</li> <li>• <b>Bezier</b> - the shutter opens and closes more gradually, according to a Bezier curve.</li> </ul>                                                                           |
| Shader Tab             |                            |               |                                                                                                                                                                                                                                                                                                                                                                                            |
| motion vectors         | output_motion_vectors_type | distance      | Sets the type of vectors you'd like to render: <ul style="list-style-type: none"> <li>• <b>off</b> - no motion vector information is rendered.</li> <li>• <b>velocity</b> - store the velocity of every single pixel in the motion vector channels.</li> <li>• <b>distance</b> - for every pixel, store the distance (in pixels) between samples in the motion vector channels.</li> </ul> |
| motion vector channels | MB_channels                | forward       | When <b>motion vectors</b> is set to anything other than <b>off</b> , the selected vector type is written to this channel or channels.                                                                                                                                                                                                                                                     |

| Control (UI)   | Knob (Scripting)      | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|-----------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| output vectors | output_shader_vectors | disabled      | When enabled, shader vectors are output as well as motion vectors.                                                                                                                                                                                                                                                                                                                                                     |
| surface points | P_channel             | none          | When <b>output vectors</b> is enabled, the shader vector surface points are written to this channel or channels.                                                                                                                                                                                                                                                                                                       |
| surface normal | N_channel             | none          | When <b>output vectors</b> is enabled, the shader vector surface normals are written to this channel or channels.                                                                                                                                                                                                                                                                                                      |
| RIB Tab        |                       |               |                                                                                                                                                                                                                                                                                                                                                                                                                        |
| filter         | ribFilter             | disabled      | <p>When enabled, filter the scene information generated by Nuke for RenderMan. Nuke then calls a Python function called <b>nukescripts.renderman.filterRIB</b>.</p> <div>  <b>Note:</b> Filtering can make the render start up slightly slower as a temporary RIB file is created for each render. </div>                            |
| arguments      | filterArgs            | none          | <p>When <b>filter</b> is enabled, specify your filter arguments. This string is passed by Nuke's Python filter function as extra arguments to RenderMan. If you want to use your own filter, you can also replace Nuke's Python function, and have your arguments passed directly to your own Python function.</p> <p>For example, set the filter arguments to <b>-rif myfilter.so</b> to load your own RI filter.</p> |
| ouput          |                       |               |                                                                                                                                                                                                                                                                                                                                                                                                                        |

# ProceduralNoise

The ProceduralNoise (or ProcGeo) node lets you modify your 3D geometry objects using a Perlin noise function that creates seemingly random noise. For example, you could use this node to generate animated noise for rippling waves or clouds, or to create a terrain from a flat card.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                               |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The 3D geometry object you want to modify using a noise function, for example, a Card node. If you want to modify several objects together, you can also connect a MergeGeo node here. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| render                 | render_mode      | unchanged     | Sets how the object will render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                                                                                                                                                                                                                              |
| ProceduralNoise Method | mode             | Turbulence    | Choose the type of noise to use: <ul style="list-style-type: none"> <li>• <b>fBm</b> (fractional Brownian motion) runs noise() "octave" times at different scales to get random numbers between -1 and +1 and adds them up.</li> <li>• <b>turbulence</b> is the same as <b>fBm</b> except it uses the absolute value of the noise function so the values it sums up are all between 0 and 1.</li> </ul> |
| Orientation            | orient           | Z             | Select the values to modify: <ul style="list-style-type: none"> <li>• <b>X</b> - only modify the values on the x axis.</li> <li>• <b>Y</b> - only modify the values on the y axis.</li> <li>• <b>Z</b> - only modify the values on the z axis.</li> <li>• <b>All</b> - modify the values on the x, y, and z axes.</li> </ul>                                                                            |
| X Size                 | x_size           | 4             | The amount of noise on the x axis.                                                                                                                                                                                                                                                                                                                                                                      |
| X Offset               | x_offset         | 0             | Offsets the noise effect on the x axis.                                                                                                                                                                                                                                                                                                                                                                 |
| Y Size                 | y_size           | 4             | The amount of noise on the y axis.                                                                                                                                                                                                                                                                                                                                                                      |
| Y Offset               | y_offset         | 0             | Offsets the noise effect on the y axis.                                                                                                                                                                                                                                                                                                                                                                 |
| Octaves                | octaves          | 5             | The amount of detail of the noise.                                                                                                                                                                                                                                                                                                                                                                      |
| Lacunarity             | lacunarity       | 2.5           | The size distribution of the empty space in between noise instances.                                                                                                                                                                                                                                                                                                                                    |
| Gain                   | gain             | 0.5           | The amount of noise gain.                                                                                                                                                                                                                                                                                                                                                                               |
| Speed                  | speed            | 1.1           | The speed with which the noise changes over time.                                                                                                                                                                                                                                                                                                                                                       |

# Project3D

The Project3D node projects an input image through a camera onto the 3D object.

See also [UVProject](#).

# Inputs and Controls

| Connection Type | Connection Name | Function                                           |
|-----------------|-----------------|----------------------------------------------------|
| Input           | cam             | The Camera controlling the projection.             |
|                 | unnamed         | The 2D image you're using for the surface texture. |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                           |
|----------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Project3D Tab  |                  |               |                                                                                                                                                                                                                                    |
| project on     | project_on       | both          | Controls whether the image is projected on the <b>front</b> facing, <b>back</b> facing, or <b>both</b> polygons.                                                                                                                   |
| crop           | crop             | enabled       | When enabled, the input image is extended at its edges with black. To extend the image with the image edge colors, disable <b>crop</b> .                                                                                           |
| occlusion mode | occlusion_mode   | disabled      | If you want to use raycasting to determine which parts of the object are occluded, check <b>self</b> to see the geometry connected to the shader or check <b>world</b> to see all the geometries in a scene that causes occlusion. |

# RadialDistort

The RadialDistort node is a non-linear transformation of the vertices along directions from the object center, giving either a barrel or pin-cushion distortion.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                           |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The 3D geometry object whose shape you want to modify. If you want to distort several objects together, you can also connect a MergeGeo node here. |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| selectable        | selectable       | enabled       | When enabled, you can make selections as normal in the Viewer. When disabled, points cannot be selected or changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| render            | render_mode      | unchanged     | Sets how the object will render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| distortion        | distortion       | 0             | Sets the amount of distortion. Values below 0 produce a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                             |
|-----------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                  |               | barrel distortion, whereas values above 0 produce a pin-cushion distortion. If you set the value to 0, the 3D object is not distorted.                               |
| power bias      | power_bias       | 4             | The magnitude of the distortion. The higher the value, the more distorted the object becomes.                                                                        |
| rotation center | center           | 0,0,0         | Move the center point of the rotation by entering its X, Y, and Z coordinates here.<br><br>You can also move the center point by dragging its control in the Viewer. |
| scale           | scale            | 1,1,1         | The amount of distortion in the x, y, or z directions.<br><br>You can also adjust this by dragging the control in the Viewer.                                        |
| preserve center | preserve_center  | enabled       | Check to keep the object centered in its original place in the 3D space. Uncheck to allow the object offset from its center.                                         |

# RayRender

When connected to a [Scene](#) node, the RayRender node renders all the objects and lights connected to that scene from the perspective of the [Camera](#) connected to the **cam** input (or a default camera if no **cam** input exists). The rendered 2D image is then passed along to the next node in the compositing tree, and you can use the result as an input to other nodes in the script.

See also [PrmanRender](#), [ScanlineRender](#), [Scene](#), and [Camera](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                    |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | cam             | An optional camera input. The scene is rendered from the perspective of this camera. If the camera input is not connected, RayRender uses a default camera positioned at the origin and facing in the negative Z direction.                                 |
|                 | obj/scn         | Either: <ul style="list-style-type: none"> <li>• A Scene node that is connected to the objects and lights you want to render, or</li> <li>• a 3D object or MergeGeo node.</li> </ul>                                                                        |
|                 | bg              | An optional background input. This can be used to composite a background image into the scene and to determine the output resolution. If not used, this defaults to <b>root.format</b> or <b>root.proxy_format</b> defined in the <b>Project Settings</b> . |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RayRender Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| filter        | filter           | Cubic         | <p>Select the filtering algorithm to use when remapping pixels from their original positions to new positions. This allows you to avoid problems with image quality, particularly in high contrast areas of the frame (where highly aliased, or jaggy, edges may appear if pixels are not filtered and retain their original values).</p> <ul style="list-style-type: none"> <li>• <b>Impulse</b> - remapped pixels carry their original values.</li> <li>• <b>Cubic</b> - remapped pixels receive some smoothing.</li> </ul> |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Sample Ray From Camera | sampleRayFromCamera | disabled      | <p>When enabled, sample rays with respect to the capture radius for a camera rig.</p> <p>Enable this control to match stereoscopic image stitches generated for a horizontal ring of cameras with a diameter set by the <b>Rig Size</b> control.</p>                                                                                                                   |
| Rig Size               | rigDiameter         | 0.1           | <p>Sets the diameter of the camera rig used to generate a corresponding stereoscopic image stitch, when <b>Sample Ray From Camera</b> is enabled.</p> <div>  <p><b>Note:</b> The <b>Rig Size</b> diameter should always be greater than the <b>Eye Separation</b> value.</p> </div> |

# ReadGeo

Imports geometry from a specified location. You can read in:

- Alembic (**.abc**) files containing meshes or point clouds. The mesh's vertices, normals, UVs, and vertex colors are read on a per frame basis or at the first frame. Materials and textures are not read in. Any cameras in the file are passed to Camera nodes.  
For more information on Alembic, see <http://code.google.com/p/alembic/>
- FBX (**.fbx**) files containing meshes or point clouds. The mesh's vertices, normals, UVs, and vertex colors are read on a per frame basis or at the first frame. Materials and textures are not read in. Any cameras in the file are passed to Camera nodes.
- OBJ (**.obj**) files
- USD (**.usd/.usda**) files containing meshes and point clouds. The mesh's vertices, normals, UVs, and vertex colors are read on a per frame basis or at the first frame. Materials and textures are not read in. Cameras

are not currently supported and are grayed-out in the scenegraph.

For more information on USD, see <https://graphics.pixar.com/usd/docs/index.html>

See also [WriteGeo](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | img             | The texture to project on to the imported geometry. |

| Control (UI)        | Knob (Scripting)   | Default Value           | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                |                  |               | and dragging the object in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| rotate         | rotate           | 0, 0, 0       | Lets you rotate the object around the x, y, and z axes. you can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                     |
| scale          | scaling          | 1, 1, 1       | Lets you scale the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| uniform scale  | uniform_scale    | 1             | Lets you scale the object simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| skew           | skew             | 0, 0, 0       | Lets you skew the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| pivot          | pivot            | 0, 0, 0       | <p>When you make changes to a 3D object's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |
| Local matrix   |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| specify matrix | useMatrix        | N/A           | Enable this to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                                                                                                                                     |
| matrix         | matrix           | N/A           | <p>The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p>                                                                                                                                                                                                                                   |

# Reflection

Reflection is the familiar physical phenomenon where an image of an object is cast back from a particular kind of surface, such as glass or water. Using the [PositionToPoints](#) node, you can replicate this effect in your render result of 3D objects, and using the Reflection node, you can adjust the controls for creating the reflection effect.

Nuke's [RayRender](#) node and [PrmanRender](#) use raytracing to create this effect and you can use the Reflection node to adjust the result.

**Note:** ScanlineRender cannot produce reflections using the Reflection node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | <p>Either:</p> <ul style="list-style-type: none"> <li>• The 2D image you're using for the surface texture, or</li> <li>• Another shader node, such as Diffuse, Specular, or Emission. Adding</li> </ul> |

| Connection Type | Connection Name | Function                                                                                                                                                                   |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                 | several shader nodes one after the other allows you to produce more complex effects.                                                                                       |
| Output          | unnamed         | The 3D geometry object to which you want to apply a reflection effect. If you want to apply the same effect to several objects, you can also connect a MergeGeo node here. |

| reflection_color | reflection_color | 1             | Sets the color of the reflection.     |
| value            | reflection_value | 1             | Sets the intensity of the reflection. |

# Refraction

Refraction is the familiar physical phenomenon of light traveling differently through different materials and thus reflecting differently off objects behind that material. For example, if you have a glass of water with a straw in it, the part of the straw that's not in water appears to be in a different angle to the part that is in the water. This is due to water bending the light waves.

**PrmanRender** uses raytracing to create this effect and you can use the Refraction node to adjust the result. Without the PrmanRender node and RenderMan Pro Server software though, the Refraction node has no effect.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                              |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | Either: <ul style="list-style-type: none"> <li>• The 2D image you're using for the surface texture, or</li> <li>• Another shader node, such as Diffuse, Specular, or Emission. Adding several shader nodes one after the other allows you to produce more complex effects.</li> </ul> |
| Output          | unnamed         | The 3D geometry object to which you want to apply a refraction effect. If you want to apply the same effect to several objects, you can also connect a MergeGeo node here.                                                                                                            |

| refraction index | refraction_index | 1             | Changes the type of refraction.       |
| value            | refraction_value | 1             | Sets the intensity of the refraction. |

## Relight

The Relight node takes a 2D image containing normal and point position passes and lets you relight it using 3D lights. Essentially bypassing the need to return to a 3D application and re-render the lighting, Relight provides a quick and interactive way to relight a 3D scene in a 2D environment.

Relight works by applying a 3D shader to a 2D image using the normal and point position passes stored in separate image channels, and lets you attach and manipulate a 3D light (or multiple lights via a Scene node).

See also [Light](#), [Spot](#), [Point](#), [Direct](#), and [Environment](#).

|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | color           | <p>The 2D image to relight using 3D lights. This image should contain normal and point position passes.</p> <p>You can create normal and point position passes using the <a href="#">DepthGenerator</a> node in NukeX, for example.</p>                                                                                                                                                                                                  |
|                 | cam             | <p>The camera used to render the <b>color</b> image.</p> <div>  <p><b>Note:</b> The <b>cam</b> input only appears once the <b>lights</b> input has been connected to a light or scene node.</p> </div>                                                                                                                                                  |
|                 | lights          | <p>The light node to use to relight the <b>color</b> image. If you want to use multiple lights, you can also connect a Scene node here.</p>                                                                                                                                                                                                                                                                                              |
|                 | material        | <p>The 3D shader to apply to the <b>color</b> image. This can be a <a href="#">Phong</a> node, for example.</p> <p>Depending on the type of shader you attach, ensure that you've defined the necessary properties for it.</p> <div>  <p><b>Note:</b> The <b>material</b> input only appears once the <b>cam</b> input has been connected.</p> </div> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                           |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------|
| Relight Tab  |                  |               |                                                                                                                                    |
| use alpha    | use_alpha        | disabled      | When enabled, the alpha channel of the <b>color</b> image is used as a mask to limit the effects of Relight on the original scene. |
| normal       | normal           | none          | The channel from the <b>color</b> input that contains the                                                                          |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                       |
|-----------------|------------------|---------------|--------------------------------------------------------------------------------|
| vectors         |                  |               | normal pass.                                                                   |
| point positions | position         | none          | The channel from the <b>color</b> input that contains the point position pass. |
| ambient         | ambient          | 0             | Sets the global ambient light level for the scene.                             |

# ScanlineRender

When connected to a [Scene](#) node, the ScanlineRender node renders all the objects and lights connected to that scene from the perspective of the [Camera](#) connected to the **cam** input (or a default camera if no **cam** input exists). The rendered 2D image is then passed along to the next node in the compositing tree, and you can use the result as an input to other nodes in the script.

The ScanlineRender node also outputs deep data if there is a Deep node downstream.

See also [PrmanRender](#), [Scene](#), and [Camera](#)

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                         |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | obj/scn         | Either: <ul style="list-style-type: none"> <li>• A Scene node that is connected to the objects and lights you want to render, or</li> <li>• a 3D object or MergeGeo node.</li> </ul>                                             |
|                 | cam             | An optional camera input. The scene is rendered from the perspective of this camera. If the camera input is not connected, ScanlineRender uses a default camera positioned at the origin and facing in the negative Z direction. |
|                 | bg              | An optional background input. This can be used to composite a                                                                                                                                                                    |

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                 | <p>background image into the scene and to determine the output resolution. If not used, this defaults to <b>root.format</b> or <b>root.proxy_format</b> defined in the <b>ProjectSettings</b>.</p> <p>If this input contains a depth channel, ScanlineRender considers it when doing Z-buffer and Z-blending calculations.</p> |

| Control (UI)       | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ScanlineRender Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| transparency       | transparency     | enabled       | When enabled, objects appear transparent where their alphas are less than 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Z-buffer           | ztest_enabled    | enabled       | Enable or disable the Z-buffer which compares object Z-depth within a scene, assisting with occlusions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| filter             | filter           | Cubic         | <p>Select the filtering algorithm to use when remapping pixels from their original positions to new positions. This allows you to avoid problems with image quality, particularly in high contrast areas of the frame (where highly aliased, or jaggy, edges may appear if pixels are not filtered and retain their original values).</p> <ul style="list-style-type: none"> <li>• <b>Impulse</b> - remapped pixels carry their original values.</li> <li>• <b>Cubic</b> - remapped pixels receive some smoothing.</li> <li>• <b>Keys</b> - remapped pixels receive some smoothing, plus minor sharpening (as shown by the negative -y portions of the curve).</li> <li>• <b>Simon</b> - remapped pixels receive some smoothing, plus medium sharpening (as shown by the negative -y portions of the curve).</li> <li>• <b>Rifman</b> - remapped pixels receive some</li> </ul> |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                 |                  |               | down the node tree may produce better results around the edges of the frame if overscan is used. Similarly, a subsequent LensDistortion node may require the use of overscan.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ambient         | ambient          | 0             | Enter a value between 0 (black) and 1 (white) to change the global ambient color.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| MultiSample Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| samples         | samples          | 1             | Sets the number of samples to render per pixel, to produce motion blur and antialiasing. If you use this, in most cases you can turn off the antialiasing and filter controls on the <b>ScanlineRender</b> tab.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| shutter         | shutter          | 0.5           | Enter the number of frames the shutter stays open when motion blurring. For example, a value of 0.5 corresponds to half a frame.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| shutter offset  | shutteroffset    | start         | <p>This value controls how the shutter behaves with respect to the current frame value. It has four options:</p> <ul style="list-style-type: none"> <li>• <b>centred</b> - center the shutter around the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29,5 to 30,5.</li> <li>• <b>start</b> - open the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 30 to 31.</li> <li>• <b>end</b> - close the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29 to 30.</li> <li>• <b>custom</b> - open the shutter at the time you specify. In the field next to the dropdown menu, enter a value (in frames) you want to add to the</li> </ul> |

| Control (UI)         | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                      |
|----------------------|---------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                      |                     |               | current frame. To open the shutter before the current frame, enter a negative value. For example, a value of - 0.5 would open the shutter half a frame before the current frame.                                                                              |
| shuttercustom offset | shuttercustomoffset | 0             | If the <b>shutter offset</b> parameter is set to <b>custom</b> , this parameter is used to set the time that the shutter opens by adding it to the current frame. Values are in frames, so -0.5 would open the shutter half a frame before the current frame. |
| randomize time       | temporal_jitter     | 0             | Adds randomness to the distribution of samples in time so they don't produce regularly spaced images. The larger the value, the larger the time difference between the samples.                                                                               |
| sample diameter      | spacial_jitter      | 1             | The diameter of the circle that the samples for each pixel are placed in for antialiasing. The larger the value, the more pixels are jittered.                                                                                                                |
| focus diameter       | focal_jitter        | 0             | Randomly orbit the camera about a point at the <b>focal distance</b> in front of it for each sample to produce depth-of-field effects from multiple samples.                                                                                                  |
|                      |                     |               | <div>  <b>Note:</b> The <b>focal distance</b> is set in the Camera node's controls, in the <b>Projection</b> tab. </div>                                                   |

| Control (UI)         | Knob (Scripting)     | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

# Scene

Regardless of its location in your script, the Scene node is the highest-level node in the scene hierarchy because it references all the elements in a 3D workspace - all the geometric objects, cameras, and lights.

Every Scene node in a script should be connected to a [ScanlineRender](#), [RayRender](#), or [PrmanRender](#) node, which render the results of the scene.

## Inputs and Controls

| Connection Type | Connection Name   | Function                                                                                         |
|-----------------|-------------------|--------------------------------------------------------------------------------------------------|
| Input           | [numbered inputs] | 3D objects, Lights, Cameras, and materials. You can connect any number of nodes to a Scene node. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| display      | display          | unchanged     | <p>Adjust the display characteristics of the 3D objects attached to the node. These settings don't affect the render output of the scene; these are for display purposes only in the 3D Viewer.</p> <ul style="list-style-type: none"> <li>• <b>off</b> - hides the 3D geometry object.</li> <li>• <b>wireframe</b> - displays only the outlines of the object geometry.</li> <li>• <b>solid</b> - displays all geometry with a solid color.</li> <li>• <b>solid + wireframe</b> - displays the geometry as solid color with the object geometry outlines.</li> <li>• <b>textured</b> - displays only the surface textures.</li> <li>• <b>textured + wireframe</b> - displays the wireframes plus the surface textures.</li> </ul> |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                           |
|----------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |               | <ul style="list-style-type: none"> <li>• <b>unchanged</b> - doesn't change object display modes.</li> </ul>                                                                                                        |
| selectable     | selectable       | enabled       | When enabled, you can make selections as normal in the Viewer. When disabled, points cannot be selected or changed.                                                                                                |
| render         | render_mode      | unchanged     | Sets how objects connected to the scene will render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                     |
| shadow         | shadow_override  | unchanged     | Determines whether geometry nodes in the scene remain <b>unchanged</b> , or are adjusted to <b>override inputs</b> . If the latter option is chosen, you can set shadow options for all the geometry in the scene. |
| cast shadow    | cast_shadow      | disabled      | If the shadow operation is set to <b>override inputs</b> , <b>cast shadow</b> enables the geometry to cast shadows on other objects.                                                                               |
| receive shadow | receive_shadow   | disabled      | If the shadows operation is set to <b>override inputs</b> , <b>receive shadow</b> enables the geometry to have shadows cast on it by other objects, provided a materials shader has been attached to the object.   |

# Specular

The Specular node controls how bright and wide the highlights on a material seem. The location of the viewpoint is significant: the specular highlights are the brightest along the direct angle of reflection.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                              |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | mapsh           | An optional mask for varying the shininess value. Where the mask is black, the shininess is set to <b>min shininess</b> . Where the mask is white, the shininess is set to <b>max shininess</b> . Values in between (where the matte is gray) are attenuated accordingly.             |
|                 | map             | The image used to modulate the specular properties of the material.                                                                                                                                                                                                                   |
|                 | unnamed         | Either: <ul style="list-style-type: none"> <li>• The 2D image you're using for the surface texture, or</li> <li>• Another shader node, such as Diffuse, Specular, or Emission. Adding several shader nodes one after the other allows you to produce more complex effects.</li> </ul> |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

# Sphere

The Sphere node creates an adjustable sphere in a 3D scene. You can map a texture on to the sphere by attaching an image to the **img** input.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                 |
|-----------------|-----------------|----------------------------------------------------------|
| Input           | img             | The texture you want to project on to the object's face. |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| scale          | scaling          | 1, 1, 1       | Lets you scale the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| uniform scale  | uniform_scale    | 1             | Lets you scale the object simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| skew           | skew             | 0, 0, 0       | Lets you skew the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| pivot          | pivot            | 0, 0, 0       | <p>When you make changes to a 3D object's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |
| Local Matrix   |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| specify matrix | useMatrix        | N/A           | Enable this to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                                                                                                                                     |
| matrix         | matrix           | N/A           | <p>The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p>                                                                                                                                                                                                                                   |

# Spot

Spot nodes create a point in 3D space that emits a cone-shaped light in a given direction. A real world example of a spot light is a desk lamp.

## Inputs and Controls

| Connection Type | Connection Name | Function                                  |
|-----------------|-----------------|-------------------------------------------|
| Input           | unnamed         | An Axis, a Camera, or another Light node. |

| Control (UI)        | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------|---------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Spot Tab            |                     |               |                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| color               | color               | 1             | Sets the color of the light.                                                                                                                                                                                                                                                                                                                                                                                                                |
| intensity           | intensity           | 1             | Sets the brightness of the light.                                                                                                                                                                                                                                                                                                                                                                                                           |
| cone angle          | cone_angle          | 40            | Sets the spot light cone angle adjusting the spread of the light. Valid angles are from 0 to 180 degrees.                                                                                                                                                                                                                                                                                                                                   |
| cone penumbra angle | cone_penumbra_angle | 0             | Controls spot light softness along the edge of the area of illumination. A negative value fades inward from the circle's edge and vice versa. The cone falloff should be set to zero or a low amount in order to see the softness.                                                                                                                                                                                                          |
| cone falloff        | cone_falloff        | 0             | Sets how much the spot light diminishes from the center of the circular region out to the edge. The higher the value, the more focused the light. The falloff is independent of the falloff type                                                                                                                                                                                                                                            |
| falloff type        | falloff_type        | No falloff    | <p>Sets the amount of light the object gets from the light source, based on the distance between the light source and the object.</p> <ul style="list-style-type: none"> <li>• <b>No falloff</b> - light does not diminish with distance.</li> <li>• <b>Linear</b> - diminish the light at a fixed rate as it travels from the object.</li> <li>• <b>Quadratic</b> and <b>Cubic</b> - diminish the light at an exponential rate.</li> </ul> |
| display             | display             | wireframe     | Adjust the display characteristics of the 3D object. These settings don't affect the render output of the scene; these                                                                                                                                                                                                                                                                                                                      |

| Control (UI)                                                                        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                                                                                     |                  |               | <p>are for display purposes only in the 3D Viewer.</p> <ul style="list-style-type: none"> <li>• <b>off</b> - hides the 3D geometry object.</li> <li>• <b>wireframe</b> - displays only the outlines of the object's geometry.</li> <li>• <b>solid</b> - displays all geometry with a solid color.</li> <li>• <b>solid+lines</b> - displays the geometry as solid color with the object's geometry outlines.</li> <li>• <b>textured</b> - displays only the surface texture.</li> <li>• <b>textured+lines</b> - displays the wireframe plus the surface texture.</li> </ul>                                                                   |
| selectable                                                                          | selectable       | enabled       | When enabled, you can make selections as normal in the Viewer. When disabled, points cannot be selected or changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|   | file_menu        | N/A           | <p>Select to import or export a channel file:</p> <ul style="list-style-type: none"> <li>• <b>Import chan file</b> - import a channel file and transform the object according to the transformation data in the channel file. Channel files contain a set of Cartesian coordinates for every frame of animation in a given shot. You can create and export them using Nuke or 3D tracking software, such as 3D-Equalizer, Maya, or Boujou.</li> <li>• <b>Export chan file</b> - export the translation parameters that you've applied to the object as a channel file. This is a useful method of sharing setups between artists.</li> </ul> |
|  | snap_menu        | N/A           | <ul style="list-style-type: none"> <li>• <b>Match selection position</b> - the object is snapped to a new position depending on the points selected.</li> <li>• <b>Match selection position, orientation</b> - the object is snapped to a new position and orientation depending on the points selected.</li> <li>• <b>Match selection position, orientation, size</b> - the object is snapped to a new position, orientation, and size depending on the points selected.</li> </ul>                                                                                                                                                         |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| transform order | xform_order      | SRT           | Sets the operation order for scale (S), rotation (R), and translation (T). The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                                                                                                                        |
| rotation order  | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZXY, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| translate       | translate        | 0, 0, 0       | Lets you translate the object along the x, y, and z axes. You can also adjust translate values by clicking and dragging the object in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                    |
| rotate          | rotate           | 0, 0, 0       | Lets you rotate the object around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                     |
| scale           | scaling          | 1, 1, 1       | Lets you scale the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| uniform scale   | uniform_scale    | 1             | Lets you scale the object simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| skew            | skew             | 0, 0, 0       | Lets you skew the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| pivot           | pivot            | 0, 0, 0       | <p>When you make changes to a 3D object's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |
| Local Matrix    |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| specify matrix  | useMatrix        | N/A           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                                                                                                                             |
| matrix          | matrix           | N/A           | The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.                                                                                                                                                                                                                                                                                                                                                                                                                        |

Increasing this value can reduce self-shadowing artifacts.</p> <p>This only applies if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>full alpha</b>.</p>                                                                                                                                                                                                                                                 |
| samples      | samples             | 1             | <p>Sets the number of samples for the light when generating soft shadows. If soft shadows in your scene appear dotty or noisy, try increasing this value. The higher the value, the smoother the soft the shadows become.</p> <p>This only applies when <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p>                                                                                                                           |
| sample width | sample_width        | 1             | <p>Sets the size of the light for soft shadows. This value determines the width of the soft area around the edge of a shadow. The higher the value, the larger the soft area.</p> <p>This control is <b>only</b> relevant if your shadows are generated using raytracing.</p>                                                                                                                                                                            |
| bias         | depthmap_bias       | 0.01          | <p>Sets the bias for the raytracing or shadow map. Increase this value if self shadowing artifacts appear in the image. This moves the surface sample point away from surface. Note, however, that if you increase the value too much, some shadows may start moving away from the base of the objects that cast them.</p> <p>This only applies when <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p>                              |
| slope bias   | depthmap_slope_bias | 0.001         | <p>Bias for the shadow map. This is like <b>bias</b>, but the offset is proportional to the slope of the depth map. This allows you to give a different offset to each value in the depth map, depending on the surface's slope relative to the light.</p> <p>If increasing <b>bias</b> reduced the existing self-shadowing artifacts but introduced more artifacts in other areas of the image, you may want to bring <b>bias</b> down a little and</p> |

| Control (UI)        | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|---------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     |                     |               | <p>increase <b>slope bias</b> instead.</p> <p>This only applies if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                      |
| clipping threshold  | clipping_threshold  | 0.5           | <p>Objects that are set to cast shadows are considered solid if their alpha is below the value set here.</p> <p>This only applies if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>clipped alpha</b>.</p>                                                                                                                                                                                                                                                                                                                                                    |
| jitter scale        | shadow_jitter_scale | 3             | <p>Sets the amount of jitter used when doing percentage-closer filtering (PCF) for soft shadows. A larger <b>jitter scale</b> value results in softer, more perceptually accurate shadows.</p> <p>PCF works by sampling the depth map at many different positions around the same spot. The final shadow value for that spot is an average of how many of the samples were occluded or visible from point of view of the light.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p> |
| depthmap resolution | depthmap_width      | 1024          | <p>Sets the resolution of the depth map. Larger values will result in a less crunchy edge, but will require more time to process.</p> <p>Note that you can also fix crunchy edges by increasing the number of <b>samples</b> instead of increasing the depth map resolution.</p> <p>This control is only relevant if your shadows are generated using depth mapping and <b>shadow mode</b> is set to <b>solid</b> or <b>clipped alpha</b>.</p>                                                                                                                                                    |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                      |
|--------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------|
| output mask  | shadow_mask      | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .      |
|              |                  | none          | Sets the channel you want to output the shadow map into. This can be enabled even if the <b>cast shadows</b> box is disabled. |

# TransformGeo

The TransformGeo node lets you translate, rotate, scale, and skew 3D geometry objects.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The 3D geometry object you want to translate, rotate, scale, or skew. If you want to transform several objects together, you can also connect a <a href="#">MergeGeo</a> node here.                                                                                                                                                                                                                                                                                                                                                                                      |
|                 | look            | <p>An optional input where you can connect a Camera or 3D object that the transformed 3D object should face. If a <b>look</b> input exists, the transformed 3D object is automatically rotated to point towards the <b>look</b> input whenever the <b>look</b> input is moved.</p> <p>This can be useful, for example, if you have a 2D matte painting mapped to a Card in your scene. The <b>look</b> input ensures that the plane of the painting always faces the camera, regardless of the camera position, and maintains the illusion depicted by the painting.</p> |
|                 | axis            | An optional Axis node input. This links the position, rotation, scale, and skew of the transformed 3D object(s) to the Axis node, so that the transformation controls on the Axis node override the corresponding                                                                                                                                                                                                                                                                                                                                                        |

| Connection Type | Connection Name | Function                                                                                                                                           |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                 | controls on the TransformGeo node.<br><br>If you've worked with other 3D applications, you may know the Axis node as a "null" or "locator" object. |

| Control (UI)                                                                        | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| skew           | skew             | 0,0,0         | Lets you skew the object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| pivot          | pivot            | 0,0,0         | <p>When you make changes to the 3D object's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |
| Local Matrix   |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Specify Matrix | useMatrix        | disabled      | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                                                                                                                       |
| matrix         | matrix           | N/A           | <p>The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>Specify Matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p>                                                                                                                                                                                                                             |
| Look Tab       |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Look Axis      | look_axis        | +Z            | The axis around which the 3D object is rotated to face the <b>look</b> input.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Rotate X       | rotate_x         | on            | Determines whether the rotation occurs around the X axis. Note that for the rotation to truly "look at" the <b>look</b> input, all three of these options must be activated.                                                                                                                                                                                                                                                                                                                                      |
| Rotate Y       | rotate_y         | on            | Determines whether the rotation occurs around the Y axis. Note that for the rotation to truly "look at" the <b>look</b> input, you have to set all three of these options.                                                                                                                                                                                                                                                                                                                                        |
| Rotate Z       | rotate_z         | on            | Determines whether the rotation occurs around the Z axis. Note that for the rotation to truly "look at" the <b>look</b>                                                                                                                                                                                                                                                                                                                                                                                           |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                    |
|-----------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                  |               | input, you have to set all three of these options.                                                                                                                          |
| Look Strength   | look_strength    | 1             | Determines to what extent the 3D object rotates to the new orientation. The smaller the value, the less the object is rotated. Setting the value to 0 produces no rotation. |
| Use Quaternions | use_quaternions  | off           | Uses an alternate scheme to calculate the <b>look</b> rotation. This option may be useful to smooth out erratic rotations along the look axis.                              |

# Transmission

The Transmission node allows you to render semi-transparent, colored shadows by simulating the absorption of light passing through a surface. The Transmission shader must be used in conjunction with lights that cast full alpha shadows.

**Note:** The Transmission node only works if your 3D scene contains a light that casts full alpha shadows and is rendered using RayRender.

See also [RayRender](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                              |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | map             | An optional mask for limiting the effect. Any changes you make to the shadows are limited to the non-black areas of the mask.                                                                                                                                                         |
|                 | unnamed         | Either: <ul style="list-style-type: none"> <li>• The 2D image you're using for the surface texture, or</li> <li>• Another shader node, such as Diffuse, Specular, or Emission. Adding several shader nodes one after the other allows you to produce more complex effects.</li> </ul> |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transmission Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| transmittance    | transmittance    | 0.18          | When <b>absorption mode</b> is set to <b>constant</b> , controls how much light passes through from the texture image. 0 is equal to no light passing through and 1 is all light passing through.                                                                                                                                                                                                                                                                                                              |
| intensity        | intensity        | 1             | Controls the intensity of the light passed through by modulating the material's absorption.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| absorption mode  | absorption_mode  | constant      | Sets the absorption mode used to calculate the shadow: <ul style="list-style-type: none"> <li>• <b>constant</b> - uses the <b>transmittance</b> control to set the amount of absorption.</li> <li>• <b>solid</b> - uses the solid component of the input material to set the amount of absorption.</li> <li>• <b>diffuse</b> - uses the diffuse component of the input material to set the amount of absorption.</li> <li>• <b>map</b> - uses the <b>map</b> input to set the amount of absorption.</li> </ul> |

# Trilinear

The Trilinear node lets you warp your 3D geometry object as a whole by using trilinear interpolation from the object's bounding box to the given destination box. For example, you can use this node to create animated object deformations, such as the squash of a bouncing ball.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                          |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The 3D geometry object you want to warp. If you want to warp several objects together, you can also connect a <a href="#">MergeGeo</a> node here. |

| Control (UI)         | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Trilinear Tab        |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| display              | display          | unchanged     | <p>Adjust the display characteristics of the 3D object. These settings don't affect the render output of the scene; these are for display purposes only in the 3D Viewer.</p> <ul style="list-style-type: none"> <li>• <b>off</b> - hides the 3D geometry object.</li> <li>• <b>wireframe</b> - displays only the outlines of the object's geometry.</li> <li>• <b>solid</b> - displays all geometry with a solid color.</li> <li>• <b>solid + wireframe</b> - displays the geometry as solid color with the object's geometry outlines.</li> <li>• <b>textured</b> - displays only the surface texture.</li> <li>• <b>textured + wireframe</b> - displays the wireframe plus the surface texture.</li> <li>• <b>unchanged</b> - doesn't change the object's display mode. The Viewer can override this setting.</li> </ul> |
| selectable           | selectable       | enabled       | When enabled, you can make selections as normal in the Viewer. When disabled, points cannot be selected or changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| render               | render_mode      | unchanged     | Sets how the object will render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| reset shape to input | reset_shape      | N/A           | Cancels your changes and resets the input to its original shape.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| copy                 | copy_shape       | N/A           | Copies the current positions of the bounding box corners ( <b>p0-p7</b> ) into a temporary buffer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| paste                | paste_shape      | N/A           | Pastes previously copied positions of the bounding box corners ( <b>p0-p7</b> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| set key              | set_key_shape    | N/A           | Sets keys for the positions of all the bounding box corners ( <b>p0-p7</b> ) on the current frame. This is the same as selecting <b>Setkey</b> from the animation menu next to each of the controls.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Control (UI)   | Knob (Scripting) | Default Value    | Function                                                                                                                                  |
|----------------|------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| delete key     | del_key_shape    | N/A              | Deletes the keys on the positions of all the bounding box corners ( <b>p0-p7</b> ) on the current frame.                                  |
| delete anim    | del_anim_shape   | N/A              | Deletes the keys on the positions of all the bounding box corners ( <b>p0-p7</b> ) on all frames.                                         |
| p0 xyz         | p0               | -0.5, -0.5, -0.5 | The x, y, and z coordinates for the <b>p0</b> corner of the bounding box. You can also adjust these by dragging the corner in the Viewer. |
| p1 xyz         | p1               | -0.5, 0.5, -0.5  | The x, y, and z coordinates for the <b>p1</b> corner of the bounding box. You can also adjust these by dragging the corner in the Viewer. |
| p2 xyz         | p2               | 0.5, 0.5, -0.5   | The x, y, and z coordinates for the <b>p2</b> corner of the bounding box. You can also adjust these by dragging the corner in the Viewer. |
| p3 xyz         | p3               | 0.5, -0.5, -0.5  | The x, y, and z coordinates for the <b>p3</b> corner of the bounding box. You can also adjust these by dragging the corner in the Viewer. |
| p4 xyz         | p4               | -0.5, -0.5, 0.5  | The x, y, and z coordinates for the <b>p4</b> corner of the bounding box. You can also adjust these by dragging the corner in the Viewer. |
| p5 xyz         | p5               | -0.5, 0.5, 0.5   | The x, y, and z coordinates for the <b>p5</b> corner of the bounding box. You can also adjust these by dragging the corner in the Viewer. |
| p6 xyz         | p6               | 0.5, 0.5, 0.5    | The x, y, and z coordinates for the <b>p6</b> corner of the bounding box. You can also adjust these by dragging the corner in the Viewer. |
| p7 xyz         | p7               | 0.5, -0.5, 0.5   | The x, y, and z coordinates for the <b>p7</b> corner of the bounding box. You can also adjust these by dragging the corner in the Viewer. |
| Source box Tab |                  |                  |                                                                                                                                           |
| use incoming   | src_use_bbox     | enabled          | By default, the node warps the bounding box of the input                                                                                  |

# UVProject

The UVProject node sets the UV coordinates for an object, allowing you to project a texture image onto the object. If the object already has UV coordinates, this node replaces them.

See also [Project3D](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                       |
|-----------------|-----------------|----------------------------------------------------------------|
| Input           | axis/cam        | The Axis or Camera node controlling the projection attributes. |
|                 | unnamed         | The 3D object onto which the texture is projected.             |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|--------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| u scale      | u_scale          | 1             | Stretches or squashes the texture on the horizontal axis.                                                                                                                                                          |
| v scale      | v_scale          | 1             | Stretches or squashes the texture on the vertical axis.                                                                                                                                                            |
| attrib name  | uv_attrib_name   | uv            | Specifies the name of the attribute to use for the UV coordinates of the upstream geometry. If your geometry has more than one set of UV coordinates, you can choose the attribute that suits the projection type. |

# UVTile

When projecting textures onto an object, use the UVTile node to modify the coordinates of a given UV (or UDIM) patch and adjust the behavior of individual patches.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                    |
|-----------------|-----------------|---------------------------------------------------------------------------------------------|
| Input           | unnamed         | The Read node with the UV (or UDIM) patch whose coordinates or behavior you want to adjust. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                          |

|              |                  |               | direction, and by ten for each texture in the V direction.                                                                                                                                                                                                                                                                                   |
| enable       | udim_enable      | disabled      | Check to enable the UDIM numbering scheme. Checking this disables the <b>u</b> and <b>v</b> fields.                                                                                                                                                                                                                                          |
| u            | tile_u           | 0             | The patch's u coordinate in UV space. Enter a value here to offset the given patch to that point.                                                                                                                                                                                                                                            |
| v            | tile_v           | 0             | The patch's v coordinate in UV space. Enter a value here to offset the given patch to that point.                                                                                                                                                                                                                                            |
| wrap mode    | wrap_u           | clamp         | Sets how existing patches are used to fill in the areas on the u axis where unique textures are not present: <ul style="list-style-type: none"> <li>• <b>clamp</b> - Patch edges are stretched indefinitely.</li> <li>• <b>repeat</b> - Patches are tiled repeatedly.</li> <li>• <b>mirror</b> - Patches are mirrored repeatedly.</li> </ul> |
|              | wrap_v           | clamp         | Sets how existing patches are used to fill in the areas on the v axis where unique textures are not present: <ul style="list-style-type: none"> <li>• <b>clamp</b> - Patch edges are stretched indefinitely.</li> <li>• <b>repeat</b> - Patches are tiled repeatedly.</li> <li>• <b>mirror</b> - Patches are mirrored repeatedly.</li> </ul> |
| translate    | translate        | 0, 0          | Translates the entire UV grid map on the x and y axes.                                                                                                                                                                                                                                                                                       |
| scale        | scale            | 1             | Scales the width and height of the UV grid map.                                                                                                                                                                                                                                                                                              |

# Wireframe

The Wireframe node allows you to render a wireframe overlay on the surface of your geometry object.

**Note:** The Wireframe node only works if you are rendering your 3D scene using ScanlineRender.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | <p>Either:</p> <ul style="list-style-type: none"> <li>• The 2D image you're using for the surface texture, or</li> <li>• Another shader node, such as Diffuse, Specular, or Emission. Adding several shader nodes one after the other allows you to produce more complex effects.</li> </ul> |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| channels      | channels         | rgba          | <p>The effect is only applied to these channels.</p> <p>You can use the checkboxes on the right to select individual channels.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| operation     | operation        | opaque        | <p>Sets how the wireframe overlay is applied to the geometry:</p> <ul style="list-style-type: none"> <li>• <b>opaque</b> - display the wireframe on fully opaque black input geometry.</li> <li>• <b>see through</b> - display the wireframe on fully transparent geometry.</li> <li>• <b>over</b> - display the wireframe on top of the input shader or texture.</li> <li>• <b>multiply</b> - multiply the wireframe by the input shader or texture and display it on fully transparent geometry.</li> <li>• <b>modulate</b> - apply standard diffuse shading to the wireframe and display it on top of the input shader or texture. This takes into account any lights in the scene.</li> </ul> |
| line width    | line_width       | 0.5           | Sets the width of the wireframe lines (in pixels).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| line color    | line_color       | 1             | Sets the color and transparency of the wireframe lines.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

# WriteGeo

Writes out geometry to a specified file. You can export:

- OBJ files
- FBX files containing meshes, point clouds, cameras, lights, and axes.
- Alembic (.abc) files containing meshes, point clouds, cameras, or axes. For more information on Alembic, see <http://code.google.com/p/alembic/>.

You can write the geometry by clicking the **Execute** button and specifying a range of frames you want written or by running the Nuke script with the **-x** switch.

See also [ReadGeo](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                         |
|-----------------|-----------------|------------------------------------------------------------------|
| Input           | unnamed         | The geometry or scene you want to write out to a specified file. |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                             |
|----------------|------------------|---------------|------------------------------------------------------------------------------------------------------|
| WriteGeo Tab   |                  |               |                                                                                                      |
| file           | file             | none          | Enter the file path and file name or use the folder icon to browse to the required location.         |
| Execute        | Execute          | N/A           | Click to write the input geometry to the file specified in the <b>file</b> control.                  |
| frame range    | first            | 1             | When <b>limit to range</b> is enabled, enter the first frame to write to the specified <b>file</b> . |
|                | last             | 1             | When <b>limit to range</b> is enabled, enter the last frame to write to the specified <b>file</b> .  |
| limit to range | use_limit        | disabled      | When enabled, enter the first and last frames to                                                     |

| Control (UI)                                                                        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------------------------------------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                     |                  |               | write to the specified <b>file</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                 |                  |               | finished. If they throw an error, the render aborts.                   |
| render progress | renderProgress   | none          | These functions run during rendering to determine progress or failure. |

# Particles Nodes

Particles nodes (NukeX and Nuke Studio only) deal with Nuke's built-in particle system, often used for creating effects like fog, smoke, rain, snow, and explosions.

## ParticleBlinkScript

The ParticleBlinkScript node is similar to the BlinkScript node, running Foundry's Blink framework it enables us to write our code once and run it on any supported device. This is achieved through code translation, in which the Blink code is turned into specific code for each target device.

Unlike the BlinkScript node which works on images, the ParticleBlinkScript node works on a particle system. It's a ParticleOp which lets you write a Blink kernel to modify the particles, allowing custom behavior that can't be achieved with Nuke's built in particle nodes.

### Inputs and Controls

| Connection Type | Connection Name | Function                                                                 |
|-----------------|-----------------|--------------------------------------------------------------------------|
| Input           | particles       | The source particles to which the ParticleBlinkScript kernel is applied. |

|---------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| transform order     | xform_order      | SRT           | Sets the operation order for scale (S), rotation (R), and translation (T). The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                                                                                                                              |
| rotation order      | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZXY, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| translate           | translate        | 0, 0, 0       | Lets you translate the region marker along the x, y, and z axes. You can also adjust translate values by clicking and dragging the axis in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                     |
| rotate              | rotate           | 0, 0, 0       | Lets you rotate the region marker around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                    |
| scale               | scaling          | 1, 1, 1       | Lets you scale the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| uniform scale       | uniform_scale    | 1             | Lets you scale the region marker simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| skew                | skew             | 0, 0, 0       | Lets you skew the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| pivot               | pivot            | 0, 0, 0       | <p>When you make changes to the region marker's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |
| <b>Local Matrix</b> |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| specify matrix      | useMatrix        | N/A           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                                                                                                                                   |
| matrix              | matrix           | N/A           | The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                               |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene. |

# ParticleBounce

With ParticleBounce, you can make your particles appear to bounce off a 3D shape instead of traveling through it. Use the ParticleBounce **object** control in combination with real geometry to make it look as though the particles are interacting with it. Each particle checks for intersection with the geometry, then bounces according to the normal at that point. This is currently limited to the primitive Nuke shapes plane, sphere, and cylinder.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                         |
|-----------------|-----------------|----------------------------------------------------------------------------------|
| Input           | geometry        | The geometry to bounce particles off when <b>object</b> is set to <b>input</b> . |
|                 | particles       | The particle system you intend to affect.                                        |

| Control (UI)       | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                               |
|--------------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ParticleBounce Tab |                  |               |                                                                                                                                                                                                                                                                                                                                        |
| display            | display          | unchanged     | Adjust the display characteristics of the particles. These settings don't affect the render output of the scene; these are for display purposes only in the 3D Viewer. <ul style="list-style-type: none"> <li>• <b>off</b> - hides the particles.</li> <li>• <b>wireframe</b> - displays only the outlines of the particle.</li> </ul> |

| Control (UI)         | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                      |                  |               | <ul style="list-style-type: none"> <li>• <b>solid</b> - displays all particles with a solid color.</li> <li>• <b>solid+wireframe</b> - displays the particles as solid color with the particles outlines.</li> <li>• <b>textured</b> - displays only the surface texture.</li> <li>• <b>textured+wireframe</b> - displays the wireframe plus the surface texture.</li> <li>• <b>unchanged</b> - doesn't change the particles display mode. The Viewer can override this setting.</li> </ul> |
| selectable           | selectable       | enabled       | When enabled, you can select the particles in the Viewer by clicking on them.                                                                                                                                                                                                                                                                                                                                                                                                               |
| render               | render_mode      | unchanged     | Sets how the particles will render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                                                                                                                                                                                                                                                                                                               |
| external bounce mode | out_bounce_mode  | bounce        | Controls particle behavior when a bounce is detected on the external surface of the bounce object: <ul style="list-style-type: none"> <li>• <b>none</b> - nothing happens and the particle moves as normal.</li> <li>• <b>bounce</b> - the particle bounces off the surface.</li> <li>• <b>kill</b> - the particle is deleted.</li> </ul>                                                                                                                                                   |
| new channels         | out_new_channels | none          | Sets the channel where a particle should be assigned to when an external bounce is detected.                                                                                                                                                                                                                                                                                                                                                                                                |
| bounce               | out_bounce       | 1             | Sets the strength of the bounce effect. Higher values cause the bounce angle to be closer to the normal, and vice versa.                                                                                                                                                                                                                                                                                                                                                                    |
| friction             | out_friction     | 0             | Controls the slow down of particles as they hit the external surface at an angle to the normal. Higher values cause a backspin effect - the bounce angle becomes closer to the normal, and vice versa.                                                                                                                                                                                                                                                                                      |
| internal bounce mode | in_bounce_mode   | bounce        | Controls particle behavior when a bounce is detected on the internal surface of the bounce object:                                                                                                                                                                                                                                                                                                                                                                                          |

|                 |                          |               | <ul style="list-style-type: none"> <li>• <b>Match selection position, orientation</b> - the bounce object is snapped to a new position and orientation depending on the points selected.</li> <li>• <b>Match selection position, orientation, size</b> - the bounce object is snapped to a new position, orientation, and size depending on the points selected.</li> </ul>                                                                                                   |
| transform order | bounceaxis_xform_order   | SRT           | Sets the operation order for scale (S), rotation (R), and translation (T). The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                                                                              |
| rotation order  | bounceaxis_rot_order     | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZXY, ZYX.                                                                                                                                                                                                                                                                                                                                                                            |
| translate       | bounceaxis_translate     | 0, 0, 0       | Lets you translate the bounce object along the x, y, and z axes. You can also adjust translate values by clicking and dragging the axis in the 3D Viewer.                                                                                                                                                                                                                                                                                                                     |
| rotate          | bounceaxis_rotate        | 0, 0, 0       | Lets you rotate the bounce object around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                    |
| scale           | bounceaxis_scaling       | 1, 1, 1       | Lets you scale the bounce object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| uniform scale   | bounceaxis_uniform_scale | 1             | Lets you scale the bounce object simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                      |
| skew            | bounceaxis_skew          | 0, 0, 0       | Lets you skew the bounce object on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| pivot           | bounceaxis_pivot         | 0, 0, 0       | <p>When you make changes to the bounce object's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the</p> |

| Control (UI)   | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                              |

|                |                   |               | pivot point to a new location in the 3D Viewer.                                                                                                                                                                                                                                       |
| Local Matrix   |                   |               |                                                                                                                                                                                                                                                                                       |
| specify matrix | useMatrix         | N/A           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                           |
| matrix         | bounceaxis_matrix | N/A           | <p>The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p> |
| Conditions Tab |                   |               |                                                                                                                                                                                                                                                                                       |
| probability    |                   |               | Sets the probability that this node affects your particles. If you set this to zero, the node won't affect any particles, and if the value is 1, the node will affect every particle.                                                                                                 |
| min age        |                   |               | Limits the effect of this node to particles above this minimum age. The age of the particle is its lifetime normalized between 0 and 1.                                                                                                                                               |
| max age        |                   |               | Limits the effect of this node to particles below this maximum age. The age of the particle is its lifetime normalized between 0 and 1.                                                                                                                                               |
| random seed    |                   |               | Sets the integer to change the results of generated randomness in your particles. You can achieve slightly different effects by changing this number.                                                                                                                                 |
| channels       |                   |               | Specifies which particle channels the effect of this node should be applied to. Channels <b>a</b> and <b>b</b> are arbitrary names for channels which are useful if you want different                                                                                                |

| Control (UI)                                                                        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                 |                  |               | and size depending on the points selected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| transform order | xform_order      | SRT           | Sets the operation order for scale (S), rotation (R), and translation (T). The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                                                                                                                              |
| rotation order  | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZXY, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| translate       | translate        | 0, 0, 0       | Lets you translate the region marker along the x, y, and z axes. You can also adjust translate values by clicking and dragging the axis in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                     |
| rotate          | rotate           | 0, 0, 0       | Lets you rotate the region marker around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                    |
| scale           | scaling          | 1, 1, 1       | Lets you scale the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| uniform scale   | uniform_scale    | 1             | Lets you scale the region marker simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| skew            | skew             | 0, 0, 0       | Lets you skew the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| pivot           | pivot            | 0, 0, 0       | <p>When you make changes to the region marker's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |

# ParticleCache

The ParticleCache node allows you to store the geometry simulation for a particle system to file. It can then be read back in different sessions of Nuke or on different machines without the need for recalculation.

This allows a particle system to be produced by an artist and then used by a render farm without recalculation, speeding up render times.

Caching does not replace the particle system rendered, as it relies on its inputs.

**Note:** ParticleCache nodes must be placed at the bottom of a single particle system or multiple merged particle systems. They cannot be placed beneath a Scene node connected to two separate streams or in the middle of a string of particle nodes.

## Inputs and Controls

| Connection Type | Connection Name | Function                                          |
|-----------------|-----------------|---------------------------------------------------|
| Input           | particles       | The particle system you intend to write to cache. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                 |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------|
| Cache Tab    |                  |               |                                                                                          |
| file         | file             | none          | Sets the file path to save the particle system to using the <b>.nkpc</b> file extension. |

| Control (UI)                                                                                                                                           | Knob (Scripting)              | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                                        |                               |               |  <b>Note:</b> ParticleCache may need to render up to 100 sub-frames. To account for this, it adds decimals to the file name's frame number. For example, if the file name in the <b>file</b> field is <b>particle_cache.####.nkpc</b> , ParticleCache may generate files called <b>particle_cache.0001.01.nkpc</b> , <b>particle_cache.0001.02.nkpc</b> , and so on. |
| padding                                                                                                                                                | particle_cache_padding        | 1             | <p>The number of extra frames added to the start and end of the ParticleCache render. This is required if you have nodes downstream requesting frames outside the normal frame range due to motion blur (for example, if you have increased the <b>shutter</b> value in a downstream ScanlineRender node).</p> <p>If you get a "Particle cache data not found" error when you enable <b>read from file</b>, you need to increase this value.</p>      |
| Render                                                                                                                                                 | Render                        | N/A           | Click to render the particle system to the location specified in the <b>file</b> control.                                                                                                                                                                                                                                                                                                                                                             |

# ParticleCurve

With ParticleCurve, you can apply a curve to particle properties (such as size or mass) to change them over time. You can, for instance, adjust the curve for your particles' alpha channel so that each particle fades to invisibility toward the end of its lifetime.

**Note:** To use the ParticleCurve with RGBA values, you need to apply a BlendMat node to the texture, and set the surface blend knob to modulate. See [BlendMat](#) for more information. This is because the ParticleCurve node edits the particle vertex color, which only works when there is no particle input. By adding a texture or shape as the particle input, this overrides the particle vertex color and uses the particle input instead. The **modulate** value in the BlendMat node multiplies the particle's texture by the vertex color, allowing them to work together.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                    |
|-----------------|-----------------|-------------------------------------------------------------|
| Input           | particles       | The particle system to which you intend to apply the curve. |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                |                  |               | axes. You can also adjust translate values by clicking and dragging the axis in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| rotate         | rotate           | 0, 0, 0       | Lets you rotate the region marker around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                    |
| scale          | scaling          | 1, 1, 1       | Lets you scale the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| uniform scale  | uniform_scale    | 1             | Lets you scale the region marker simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| skew           | skew             | 0, 0, 0       | Lets you skew the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| pivot          | pivot            | 0, 0, 0       | <p>When you make changes to the region marker's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |
| Local Matrix   |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| specify matrix | useMatrix        | N/A           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                                                                                                                                   |
| matrix         | matrix           | N/A           | <p>The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p>                                                                                                                                                                                                                                         |

# ParticleDirectionalForce

Use ParticleDirectionalForce to apply a directional force, rather like gravity, to your particles.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                    |
|-----------------|-----------------|-------------------------------------------------------------|
| Input           | particles       | The particle system to which you intend to apply the force. |

| Control (UI)                 | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ParticleDirectionalForce Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| display                      | display          | unchanged     | <p>Adjust the display characteristics of the particles. These settings don't affect the render output of the scene; these are for display purposes only in the 3D Viewer.</p> <ul style="list-style-type: none"> <li>• <b>off</b> - hides the particles.</li> <li>• <b>wireframe</b> - displays only the outlines of the particle.</li> <li>• <b>solid</b> - displays all particles with a solid color.</li> <li>• <b>solid+wireframe</b> - displays the particles as solid color with the particles outlines.</li> <li>• <b>textured</b> - displays only the surface texture.</li> <li>• <b>textured+wireframe</b> - displays the wireframe plus the surface texture.</li> <li>• <b>unchanged</b> - doesn't change the particles display mode. The Viewer can override this setting.</li> </ul> |
| selectable                   | selectable       | enabled       | When enabled, you can select the particles in the Viewer by clicking on them.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| render                       | render_mode      | unchanged     | Sets how the particles will render. This control is independent from the <b>display</b> selection, but has the                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                  |
|------------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  |                  |               | same settings.                                                                                                                                                                                                                                                                                                            |
| Strength xyz     | strength         | 0, 0, 0       | Sets the direction of force applied to the particles on the <b>x</b> , <b>y</b> , and <b>z</b> axes.                                                                                                                                                                                                                      |
| Uniform Strength | uniformStrength  | 1             | Sets the strength applied to the directional force specified in the <b>Strength</b> control.                                                                                                                                                                                                                              |
| Conditions Tab   |                  |               |                                                                                                                                                                                                                                                                                                                           |
| probability      | probability      | 1             | Sets the probability that this node affects your particles. If you set this to zero, the node won't affect any particles, and if the value is 1, the node will affect every particle.                                                                                                                                     |
| min age          | min_age          | 0             | Limits the effect of this node to particles above this minimum age. The age of the particle is its lifetime normalized between 0 and 1.                                                                                                                                                                                   |
| max age          | max_age          | 1             | Limits the effect of this node to particles below this maximum age. The age of the particle is its lifetime normalized between 0 and 1.                                                                                                                                                                                   |
| random seed      | seed             | 0             | Sets the integer to change the results of generated randomness in your particles. You can achieve slightly different effects by changing this number.                                                                                                                                                                     |
| channels         | channels         | all           | Specifies which particle channels the effect of this node should be applied to. Channels <b>a</b> and <b>b</b> are arbitrary names for channels which are useful if you want different ParticleEmitter nodes or other particle force nodes to have an effect on separate channels.                                        |
| Region Tab       |                  |               |                                                                                                                                                                                                                                                                                                                           |
| region           | region           | none          | <p>Sets the region which you want to use to confine the particle effect to. For example, if you choose a <b>sphere</b>, only particles inside that sphere shaped region will be affected by particle effects.</p> <ul style="list-style-type: none"> <li>• <b>none</b> - all particles are affected as normal.</li> </ul> |

| Control (UI)                                                                        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| translate      | translate        | 0, 0, 0       | Lets you translate the region marker along the x, y, and z axes. You can also adjust translate values by clicking and dragging the axis in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                     |
| rotate         | rotate           | 0, 0, 0       | Lets you rotate the region marker around the x, y, and z axes. you can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                    |
| scale          | scaling          | 1, 1, 1       | Lets you scale the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| uniform scale  | uniform_scale    | 1             | Lets you scale the region marker simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| skew           | skew             | 0, 0, 0       | Lets you skew the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| pivot          | pivot            | 0, 0, 0       | <p>When you make changes to the region marker's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |
| Local Matrix   |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| specify matrix | useMatrix        | N/A           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                                                                                                                                   |
| matrix         | matrix           | N/A           | <p>The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p>                                                                                                                                                                                                                                         |

# ParticleDrag

With ParticleDrag, you can apply drag on your particles to gradually alter their velocity over time. This means particles will start off fast and gradually slow down, unless you use negative values to apply the reverse effect.

The formula is: **particle velocity\*(1-drag)**. If the drag value is 0.01, the particles lose 1% of their velocity per frame.

## Inputs and Controls

| Connection Type | Connection Name | Function                                               |
|-----------------|-----------------|--------------------------------------------------------|
| Input           | particles       | The particle system to which you intend to apply drag. |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| ParticleDrag Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| display          | display          | unchanged     | <p>Adjust the display characteristics of the particles. These settings don't affect the render output of the scene; these are for display purposes only in the 3D Viewer.</p> <ul style="list-style-type: none"> <li>• <b>off</b> - hides the particles.</li> <li>• <b>wireframe</b> - displays only the outlines of the particle.</li> <li>• <b>solid</b> - displays all particles with a solid color.</li> <li>• <b>solid+wireframe</b> - displays the particles as solid color with the particles outlines.</li> <li>• <b>textured</b> - displays only the surface texture.</li> <li>• <b>textured+wireframe</b> - displays the wireframe plus the surface texture.</li> <li>• <b>unchanged</b> - doesn't change the particles display mode. The Viewer can override this setting.</li> </ul> |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                         |
|-----------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| selectable      | selectable       | enabled       | When enabled, you can select the particles in the Viewer by clicking on them.                                                                                                                                                                                                                    |
| render          | render_mode      | unchanged     | Sets how the particles will render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                                                                                                                    |
| drag            | drag             | 0             | <p>Sets the proportion of each particle's velocity that is lost per frame, where 0.01 = 1 percent and 1 = 100 percent.</p> <div>  <b>Note:</b> Negative drag values increase the particle velocity. </div>      |
| rotational drag | rotational_drag  | 0             | <p>Sets the proportion of each particle's rotation that is lost per frame, where 0.01 = 1 percent and 1 = 100 percent.</p> <div>  <b>Note:</b> Negative values increase the particle rotation velocity. </div> |
| Conditions Tab  |                  |               |                                                                                                                                                                                                                                                                                                  |
| probability     | probability      | 1             | Sets the probability that this node affects your particles. If you set this to zero, the node won't affect any particles, and if the value is 1, the node will affect every particle.                                                                                                            |
| min age         | min_age          | 0             | Limits the effect of this node to particles above this minimum age. The age of the particle is its lifetime normalized between 0 and 1.                                                                                                                                                          |
| max age         | max_age          | 1             | Limits the effect of this node to particles below this maximum age. The age of the particle is its lifetime normalized between 0 and 1.                                                                                                                                                          |
| random seed     | seed             | 0             | Sets the integer to change the results of generated randomness in your particles. You can achieve slightly different effects by changing this number.                                                                                                                                            |
| channels        | channels         | all           | Specifies which particle channels the effect of this node                                                                                                                                                                                                                                        |

|                 |                  |               | <ul style="list-style-type: none"> <li>• <b>Match selection position, orientation, size</b> - the region marker is snapped to a new position, orientation, and size depending on the points selected.</li> </ul>                                                                                                                                                                                                                                                                                                              |
| transform order | xform_order      | SRT           | Sets the operation order for scale (S), rotation (R), and translation (T). The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                                                                                                                              |
| rotation order  | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZXY, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| translate       | translate        | 0, 0, 0       | Lets you translate the region marker along the x, y, and z axes. you can also adjust translate values by clicking and dragging the axis in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                     |
| rotate          | rotate           | 0, 0, 0       | Lets you rotate the region marker around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                    |
| scale           | scaling          | 1, 1, 1       | Lets you scale the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| uniform scale   | uniform_scale    | 1             | Lets you scale the region marker simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| skew            | skew             | 0, 0, 0       | Lets you skew the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| pivot           | pivot            | 0, 0, 0       | <p>When you make changes to the region marker's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |
| Local Matrix    |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                              |
|----------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| specify matrix | useMatrix        | N/A           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                           |
| matrix         | matrix           | N/A           | <p>The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p> |

# ParticleEmitter

ParticleEmitter is the only required node for creating particles, but with no geometry input the normal along which particles travel is the y-axis. Once you've connected a Viewer and your geometry, click play on the timeline to see the default set of particles emitting from your geometry.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                    |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | particle        | The image or geometry to emit as particles - when you connect up this input, another particle input is created allowing you to mix particle types. You can also use a <a href="#">PositionToPoints</a> point cloud as the emitted particle. |
|                 | emit            | <p>The geometry from which the particles are emitted. You can also emit from PositionToPoints point clouds using any normals information present.</p> <p>See <a href="#">PositionToPoints</a> for more information.</p>                     |
|                 | merge           | Another particle system, including another ParticleEmitter.                                                                                                                                                                                 |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ParticleEmitter Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| display             | display          | unchanged     | <p>Adjust the display characteristics of the particles. These settings don't affect the render output of the scene; these are for display purposes only in the 3D Viewer.</p> <ul style="list-style-type: none"> <li>• <b>off</b> - hides the particles.</li> <li>• <b>wireframe</b> - displays only the outlines of the particle.</li> <li>• <b>solid</b> - displays all particles with a solid color.</li> <li>• <b>solid+wireframe</b> - displays the particles as solid color with the particles outlines.</li> <li>• <b>textured</b> - displays only the surface texture.</li> <li>• <b>textured+wireframe</b> - displays the wireframe plus the surface texture.</li> <li>• <b>unchanged</b> - doesn't change the particles display mode. The Viewer can override this setting.</li> </ul> |
| selectable          | selectable       | enabled       | When enabled, you can select the particles in the Viewer by clicking on them.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| render              | render_mode      | unchanged     | Sets how the particles will render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| start at            | start_frame      | 0             | <p>Sets which frame the particles start emitting. Negative values cause the particles to start before frame 0, and positive values delay the particles.</p> <p>For example, you might want your particles to start before time zero, allowing them to spread out before rendering - the snow is already there, not just starting to fall.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| channels            | channels         | a             | The particles only exist in the selected channel(s).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| emit from           | emit_from        | points        | <p>Sets where particles emit from:</p> <ul style="list-style-type: none"> <li>• <b>points</b> - emit from geometry points, including PositionToPoints point clouds.</li> <li>• <b>edges</b> - emit from geometry edges.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Control (UI)  | Knob (Scripting) | Default Value       | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                  |                     | <ul style="list-style-type: none"> <li>• <b>faces</b> - emit from geometry faces.</li> </ul> <div>  <b>Note:</b> Enabling <b>only emit from selected</b> allows you to emit from points selected in a preceding GeoSelect node. </div> <ul style="list-style-type: none"> <li>• <b>bbox</b> - emit from within the volume defined by the bbox of the geometry, which can reduce the need for pre-roll, start at, when creating volumetric particle simulations.</li> </ul>                                                                                                            |
|               | emit_order       | randomly            | Sets how particles are emitted: <ul style="list-style-type: none"> <li>• <b>randomly</b> - particles are emitted from a random point on each face, though the same seed is used each time once generated.</li> <li>• <b>uniformly</b> - particles are emitted from every vertex on every frame, ignoring the <b>emission rate</b> setting.</li> <li>• <b>in order</b> - particles are emitted from the vertices of the geometry input in ascending order.</li> </ul>                                                                                                                                                                                                   |
|               | randomize_type   | no_random_direction | Sets how the initial particle velocity directions are randomized: <ul style="list-style-type: none"> <li>• <b>no random direction</b> - directions are not randomized. The emit object's normals are used to determine direction.</li> <li>• <b>randomized direction</b> - the initial directions are completely randomized.</li> <li>• <b>randomized outwards</b> - a randomly selected direction, depending on <b>emit from</b>: <ul style="list-style-type: none"> <li><b>bbox</b> - particles move away from the center.</li> <li><b>points, edges, and faces</b> - particles move away at no more than 90 degrees from the nearest normal.</li> </ul> </li> </ul> |
| emission rate | rate             | 10                  | Sets the exact number of particles emitted per frame and is affected by the <b>rate channel</b> control. If your <b>rate</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Control (UI)            | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------|---------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                         |                     |               | <b>channel</b> is less than 1 all the way through, the emission rate lessens.                                                                                                                                                                                                                                                                                                                                                                                                           |
| only emit from selected | selection_only      | disabled      | When enabled, only points selected in a preceding GeoSelect node are used as <b>emit from</b> sites. See <a href="#">GeoSelect</a> for more information.                                                                                                                                                                                                                                                                                                                                |
| threshold               | selection_threshold | 0.5           | When <b>only emit from selected</b> is enabled and <b>emit from</b> is set to something other than <b>points</b> , this control indicates the threshold used for selection testing. For example, if set to 0.5 then the boundary is exactly halfway between selected and unselected points.                                                                                                                                                                                             |
| vertex emission rate    | vertex_rate         | 1             | <p>When <b>emit_order</b> is set to <b>uniformly</b>, sets the number of particles emitted per vertex per frame. It is an exact number, not an average, and decreases if you change the probability.</p> <div>  <b>Note:</b> This control is affected by the setting of the rate channel. If your rate channel is not at a value of 1 all the way through, the emission rate is less.         </div> |
| rate variation          | rate_variation      | 0             | <p>Produces a random emission variation by adding a Gaussian-distributed random number to the <b>emission rate</b> value multiplied by the <b>rate variation</b> value.</p> <p>Roughly speaking, 0 is equal to the <b>emission rate</b> and 1 is very random variation.</p>                                                                                                                                                                                                             |
| rate channel            | N/A                 | disabled      | Enables the associated rate channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                           |
|                         | rate_channel        | none          | Sets the channel of the input geometry texture which is used to modulate the <b>emission rate</b> . You can use this control to emit particles from certain areas of the input geometry.                                                                                                                                                                                                                                                                                                |

| Control (UI)       | Knob (Scripting)   | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|--------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    |                    |               | For example, if you are emitting from a Card which has a Ramp texture, more particles are emitted from the light part of the Ramp (values closer to 1) than from the dark parts (values closer to 0).                                                                                                                                                                                                 |
| max lifetime       | lifetime           | 10            | Sets the number of frames that each particle exists for.                                                                                                                                                                                                                                                                                                                                              |
| max lifetime range | lifetime_variation | 0             | <p>Produces a random lifetime variation by adding a Gaussian-distributed random number to the <b>max lifetime</b> value multiplied by the <b>max lifetime range</b> value.</p> <p>Roughly speaking, 0 is equal to the <b>max lifetime</b> and 1 is very random variation.</p>                                                                                                                         |
| lifetime channel   | N/A                | disabled      | Enables the associated lifetime channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                     |
|                    | lifetime_channel   | none          | <p>Sets the channel of the input geometry texture which is used to modulate the <b>max lifetime</b>.</p> <p>For example, if you are emitting from a Card which has a Ramp texture, particles emitted from the light parts of the ramp (values closer to 1) have a lifetime value closer to that set in the <b>max lifetime</b> than particles emitted from the dark parts (values closer to 0).</p>   |
| halflife           | halflife           | 0             | <p>Sets a <b>halflife</b> causing a fraction of the particles to die randomly each frame such that on average, half of the particles that existed at a given time will continue to exist after the <b>halflife</b> (in the same way as radioactive decay).</p> <p>For example, after twice the <b>halflife</b> value in frames, only a quarter of the original particles will be left, and so on.</p> |
| velocity           | velocity           | 1             | Sets the speed in units per frame of the particles as they leave the emitter.                                                                                                                                                                                                                                                                                                                         |
| velocity range     | velocity_          | 0             | Produces a random velocity variation by adding a                                                                                                                                                                                                                                                                                                                                                      |

|                    |                    |               | <p>by the <b>mass range</b> value.</p> <p>Roughly speaking, 0 is equal to the <b>mass</b> and 1 is very random variation.</p>                                                                                                                                                                                                                                                                                                                                                                |
| mass channel       | N/A                | disabled      | <p>Enables the associated mass channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b>.</p>                                                                                                                                                                                                                                                                                                                                                          |
|                    | mass_channel       | none          | <p>Sets the channel of the input geometry texture which is used to modulate the <b>mass</b> of the particles. You can use this control to emit particles with different mass from different areas.</p> <p>For example, if you are emitting from a Card which has a Ramp texture, the particles from the light part of the Ramp (values closer to 1) will have a higher <b>mass</b> value (based on a percentage of the <b>mass</b> value) than from the dark parts (values closer to 0).</p> |
| transfer velocity  | transfer_velocity  | 0             | <p>Sets the transfer strength of any velocity that the initial emitter had to the particles.</p> <p>Setting this to 0 transfers no velocity to the spawned particles. At value 1, full velocity is transferred from the originating particle.</p>                                                                                                                                                                                                                                            |
| transfer window    | transfer_window    | 1             | <p>Sets the time, in frames, to look forward and backward to determine the <b>transfer velocity</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                     |
| spread             | spread             | 0             | <p>Applies a spread to the particles - by default, a cone shape around the direction of emission.</p>                                                                                                                                                                                                                                                                                                                                                                                        |
| color              | color              | 1             | <p>Sets the initial color of particles when the <b>particle</b> input is not connected.</p>                                                                                                                                                                                                                                                                                                                                                                                                  |
| color from texture | color_from_texture | disabled      | <p>When enabled, the particles take their initial color from the color of the emitter geometry texture at the point of emission. The color modulates as the texture changes.</p>                                                                                                                                                                                                                                                                                                             |
| input order        | input_order        | randomly      | <p>Sets the order of <b>particle</b> inputs used for the</p>                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Control (UI)    | Knob (Scripting)      | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                       |               | representation: <ul style="list-style-type: none"> <li>• <b>randomly</b> - a random input is picked for each particle emitted.</li> <li>• <b>in order</b> - the inputs are cycled through for each particle emitted.</li> </ul>                                                                                                                                                                                                                                |
| start at        | start_frame_animation | first         | Determines which frame a newly emitted particle's representation starts from: <ul style="list-style-type: none"> <li>• <b>first</b> - uses the first frame from the input for each new particle.</li> <li>• <b>in order</b> - uses successive frames for each new particle.</li> <li>• <b>current</b> - uses the frame from which the particle was emitted.</li> <li>• <b>random</b> - uses a random frame within the representation's frame range.</li> </ul> |
| limit to range  | start_wrap            | disabled      | When enabled, particle start frames are forced to be within the range of the representation input. This causes the <b>start at &gt; in order</b> and <b>current</b> options to wrap round back to the start of the frame range once it has been exceeded, in a continuous loop.                                                                                                                                                                                |
| advance         | frame_advance         | in steps      | Determines whether particle representations animate after emission: <ul style="list-style-type: none"> <li>• <b>constant</b> - particles do not animate, and keep the same representation for their entire lifetime.</li> <li>• <b>in steps</b> - the particle's representation advances frame by frame.</li> <li>• <b>randomly</b> - a different random frame is picked each time.</li> </ul>                                                                 |
| max clip length | max_clip_length       | 100           | Sets the number of frames used in animation from the representation input.                                                                                                                                                                                                                                                                                                                                                                                     |
| random seed     | seed                  | 0             | Sets a random seed to create more varied results, for example in conjunction with the range controls in the emitter such as <b>velocity range</b> . You can achieve slightly                                                                                                                                                                                                                                                                                   |

| Control (UI)                                                                        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                 |                  |               | and size depending on the points selected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| transform order | xform_order      | SRT           | Sets the operation order for scale (S), rotation (R), and translation (T). The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                                                                                                                              |
| rotation order  | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZXY, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| translate       | translate        | 0, 0, 0       | Lets you translate the region marker along the x, y, and z axes. You can also adjust translate values by clicking and dragging the axis in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                     |
| rotate          | rotate           | 0, 0, 0       | Lets you rotate the region marker around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                    |
| scale           | scaling          | 1, 1, 1       | Lets you scale the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| uniform scale   | uniform_scale    | 1             | Lets you scale the region marker simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| skew            | skew             | 0, 0, 0       | Lets you skew the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| pivot           | pivot            | 0, 0, 0       | <p>When you make changes to the region marker's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |

# ParticleExpression

With ParticleExpression, you can adjust your particles by setting expressions on their attributes. Using expressions gives you a vast variety of ways of adjusting the way your particles behave. You can use a similar expression syntax as you would elsewhere in Nuke, with the exception that some functions which work in normal Nuke expressions aren't available in particle expressions and vice versa. The main difference between Nuke's Expression node and ParticleExpression is that particle expressions can return a 3D vector instead of just a single floating point number. If a particle expression returns a single number N in a field that expects a vector (such as velocity or acceleration) it will be converted into a vector with N for each of its components. For more information about functions you can use with ParticleExpression, see Nuke's [online help](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                      |
|-----------------|-----------------|---------------------------------------------------------------|
| Input           | particles       | The particle system to which you intend to apply expressions. |

| Control (UI)           | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                      |
|------------------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ParticleExpression Tab |                  |               |                                                                                                                                                                                                                                                                                                                                               |
| [temp name field]      | temp_name0       | N/A           | If you need to use a long expression in several fields, you can use this row for assigning the expression temporarily to a variable. Enter the variable name here, and the expression on the right of the = sign. You can then use the variable to represent the expression in the = fields next to the other particle controls.              |
| =                      | temp_expr0       | N/A           | If you need to use a long expression in several fields, you can use this row for assigning the expression temporarily to a variable. Enter the variable name on the left side of the = sign, and the expression in this field. You can then use the variable to represent the expression in the = fields next to the other particle controls. |
| per-particle           | temp_expr0_pp    | enabled       | When enabled, this temporary expression is evaluated per-particle.                                                                                                                                                                                                                                                                            |
| [temp name field]      | temp_name1       | N/A           | If you need to use a long expression in several fields, you can use this row for assigning the expression temporarily to a variable. Enter the variable name here, and the expression on the right of the = sign. You can then use the variable to represent the expression in the = fields next to the other particle controls.              |
| =                      | temp_expr1       | N/A           | If you need to use a long expression in several fields, you can use this row for assigning the expression temporarily to a variable. Enter the variable name on the left side of the = sign, and the expression in this field. You can then use the variable to represent the expression in the = fields next to the other particle controls. |
| per-particle           | temp_expr1_pp    | enabled       | When enabled, this temporary expression is evaluated per-particle.                                                                                                                                                                                                                                                                            |

|                 |                  |               | <ul style="list-style-type: none"> <li>• <b>Match selection position, orientation, size</b> - the region marker is snapped to a new position, orientation, and size depending on the points selected.</li> </ul>                                                                                                                                                                                                                                                                                                              |
| transform order | xform_order      | SRT           | Sets the operation order for scale (S), rotation (R), and translation (T). The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                                                                                                                              |
| rotation order  | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZXY, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| translate       | translate        | 0, 0, 0       | Lets you translate the region marker along the x, y, and z axes. You can also adjust translate values by clicking and dragging the axis in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                     |
| rotate          | rotate           | 0, 0, 0       | Lets you rotate the region marker around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                    |
| scale           | scaling          | 1, 1, 1       | Lets you scale the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| uniform scale   | uniform_scale    | 1             | Lets you scale the region marker simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| skew            | skew             | 0, 0, 0       | Lets you skew the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| pivot           | pivot            | 0, 0, 0       | <p>When you make changes to the region marker's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                              |

| specify matrix | useMatrix        | N/A           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                           |
| matrix         | matrix           | N/A           | <p>The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p> |

# ParticleGravity

With ParticleGravity, you can apply gravity to your particles. Unlike our familiar gravity, particle gravity works in any or all of the x, y and z directions, and you can also set negative values to them. When you connect the ParticleGravity node to your particle stream, an arrow appears in the Viewer, which you can then use to control the gravity. The bigger and longer the arrow, the stronger the gravity effect.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                  |
|-----------------|-----------------|-----------------------------------------------------------|
| Input           | particles       | The particle system to which you intend to apply gravity. |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                   |
|---------------------|------------------|---------------|------------------------------------------------------------|

# ParticleInfo

The ParticleInfo node displays particle data from any particle system attached to the node's input, which is useful for troubleshooting if your particles aren't behaving correctly. For example, if a particle's texture didn't display as expected, you could enable **orientation as axis** to overlay axes in the 3D Viewer to check the particle's orientation. Available data includes particle index, velocity, and position as well as the total number of particles in the system. The maximum number of particles within a system in Nuke is 1000000.

# Inputs and Controls

| Connection Type | Connection Name | Function                                                        |
|-----------------|-----------------|-----------------------------------------------------------------|
| Input           | particles       | The particle system from which to display particle information. |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| display          | display          | unchanged     | <p>Adjust the display characteristics of the particles. These settings don't affect the render output of the scene; these are for display purposes only in the 3D Viewer.</p> <ul style="list-style-type: none"> <li>• <b>off</b> - hides the particles.</li> <li>• <b>wireframe</b> - displays only the outlines of the particle.</li> <li>• <b>solid</b> - displays all particles with a solid color.</li> <li>• <b>solid+wireframe</b> - displays the particles as solid color with the particles outlines.</li> <li>• <b>textured</b> - displays only the surface texture.</li> <li>• <b>textured+wireframe</b> - displays the wireframe plus the surface texture.</li> <li>• <b>unchanged</b> - doesn't change the particle's display mode. The Viewer can override this setting.</li> </ul> |
| selectable       | selectable       | on            | When enabled, you can select the particles in the Viewer by clicking on them.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                     |
|--------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| render       | render_mode      | unchanged     | Sets how the particles are rendered. This control is independent from the <b>display</b> selection, but has the same settings.                               |
| show count   | show_count       | on            | Displays the total particle count in the system attached to the node, up to a maximum of 1000000.                                                            |
| index        | showIndex        | off           | Displays the index of each particle in the system starting from 0 for the first particle.                                                                    |
| ID           | showId           | off           | Displays the unique identifier assigned to each particle in the system after it is emitted.                                                                  |
| frame        | showFrame        | off           | Displays the current frame for each particle's texture.                                                                                                      |
| first frame  | showFirstFrame   | off           | Displays the first frame for each particle's texture.                                                                                                        |
| last frame   | showLastFrame    | off           | Displays the last frame for each particle's texture.                                                                                                         |
| time         | showTime         | off           | Displays the age of each particle since it was emitted, in frames.                                                                                           |
| life         | showLife         | off           | Displays the maximum lifetime of each particle as set in the ParticleEmitter <b>max lifetime</b> control and within the <b>max lifetime range</b> specified. |
| age          | showAge          | off           | Displays each particles age, which is calculated as <b>time/life</b> and shown as a value between 0 and 1.                                                   |
| velocity as  | showVelocity     | off           | Displays the velocity of each                                                                                                                                |

| Control (UI)              | Knob (Scripting)         | Default Value | Function                                                                                                                                                                                                     |
|---------------------------|--------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| text                      |                          |               | particle at the current frame as an XYZ coordinate direction.                                                                                                                                                |
| velocity as vector        | showVelocityAsVector     | off           | Displays the velocity of each particle at the current frame as an arrow indicating direction. The length of the arrow also indicates the particle's position in the next frame.                              |
| orientation as text       | showOrientation          | off           | Displays the orientation of each particle at the current frame as a quaternion, the quotient of two vectors.                                                                                                 |
| orientation as axis       | showOrientationAsAxis    | off           | Displays the orientation of each particle at the current frame as XYZ axes.                                                                                                                                  |
| rotation axis as text     | showRotationAxis         | off           | Displays the rotation axis as text. The rotation axis is the axis around which particles rotate if <b>rotation_velocity</b> in the ParticleEmitter is set to anything other than 0.                          |
| rotation axis as vector   | showRotationAxisAsVector | off           | Displays the rotation axis as an arrow indicating direction. The rotation axis is the axis around which particles rotate if <b>rotation_velocity</b> in the ParticleEmitter is set to anything other than 0. |
| sprite rotation (degrees) | showRotationAngle        | off           | When emitting sprites, displays the rotation of each sprite at the current frame in degrees.                                                                                                                 |
| position                  | showPosition             | off           | Displays the position of each particle at the current frame in relation to the emitter origin as an                                                                                                          |

| Control (UI)          | Knob (Scripting)            | Default Value | Function                                                                                                                                                                                                    |
|-----------------------|-----------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       |                             |               | XYZ coordinate.                                                                                                                                                                                             |
| last pos as text      | showLastPosition            | off           | Displays the position of each particle in the previous frame in relation to the emitter origin as an XYZ coordinate.                                                                                        |
| last pos as vector    | showLastPositionAsVector    | off           | Displays the position of each particle in the previous frame as an arrow indicating direction to the current frame.                                                                                         |
| initial pos as text   | showInitialPosition         | off           | Displays the initial position of each particle as an XYZ coordinate.                                                                                                                                        |
| initial pos as vector | showInitialPositionAsVector | off           | Displays the initial position of each particle as an arrow indicating direction to the current frame.                                                                                                       |
| color                 | showColor                   | off           | Displays the RGBA values of each particle at the current frame .                                                                                                                                            |
| size                  | showSize                    | off           | Displays the size of each particle as set in the ParticleEmitter <b>size</b> control and within the <b>size range</b> specified.                                                                            |
| mass                  | showMass                    | off           | Displays the mass of each particle as set in the ParticleEmitter <b>mass</b> control and within the <b>mass range</b> specified. A particle's mass is only useful when a force is applied to the particles. |
| channels              | showChannels                | off           | Particles are emitted with channels <b>a</b> by default. You can change the channels with a ParticleExpression or                                                                                           |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                               |
|----------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |               | ParticleBounce node so that downstream nodes only act on particles in certain channels. For example, you could emit particles you don't want gravity to affect in channel <b>b</b> and set your ParticleGravity node to only affect channel <b>a</b> . |
| axis scale     | axisScale        | 1             | When controls like <b>velocity as vector</b> and <b>orientation as axis</b> are enabled, controls the size of the axis or axes displayed in the Viewer for each particle.                                                                              |
| first particle | firstParticle    | 0             | Controls the range of particles for which information is displayed, starting from the index of the <b>first particle</b> specified.                                                                                                                    |
| max particles  | maxParticles     | 1000          | You can use the <b>max particles</b> control to limit the amount of information on screen in large particle systems.                                                                                                                                   |

# ParticleLookAt

With ParticleLookAt, you can determine a 3D point at which all the particles within a certain region are looking toward.

# Inputs and Controls

| Connection Type | Connection Name | Function                                                      |
|-----------------|-----------------|---------------------------------------------------------------|
| Input           | particles       | The particle system you intend to align with a certain point. |

| Control (UI)       | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                             |
| translate                                                                         | translate        | 0, 0, 0       | Lets you translate the region marker along the x, y, and z axes. You can also adjust translate values by clicking and dragging the axis in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                 |
| rotate                                                                            | rotate           | 0, 0, 0       | Lets you rotate the region marker around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                |
| scale                                                                             | scaling          | 1, 1, 1       | Lets you scale the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| uniform scale                                                                     | uniform_scale    | 1             | Lets you scale the region marker simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| skew           | skew             | 0, 0, 0       | Lets you skew the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| pivot          | pivot            | 0, 0, 0       | <p>When you make changes to the region marker's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |
| Local Matrix   |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| specify matrix | useMatrix        | N/A           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                                                                                                                                   |
| matrix         | matrix           | N/A           | <p>The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p>                                                                                                                                                                                                                                         |

# ParticleMerge

If you have more than one set of particle nodes, and you want to combine them into one stream, ParticleMerge is your node. Attach your particle streams to ParticleMerge's numbered inputs and you're all set.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                               |
|-----------------|-----------------|--------------------------------------------------------------------------------------------------------|
| Input           | numbered inputs | The first particle system you intend to merge. Adding a particle system spawns another numbered input. |

# ParticleMotionAlign

You can add ParticleMotionAlign in your particle stream to realign all the particles along their direction of motion.

## Inputs and Controls

| Connection Type | Connection Name | Function                                 |
|-----------------|-----------------|------------------------------------------|
| Input           | particles       | The particle system you intend to align. |

| Control (UI)            | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ParticleMotionAlign Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| display                 | display          | unchanged     | Adjust the display characteristics of the particles. These settings don't affect the render output of the scene; these are for display purposes only in the 3D Viewer. <ul style="list-style-type: none"> <li>• <b>off</b> - hides the particles.</li> <li>• <b>wireframe</b> - displays only the outlines of the particle.</li> <li>• <b>solid</b> - displays all particles with a solid color.</li> <li>• <b>solid+wireframe</b> - displays the particles as solid color</li> </ul> |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                            |
|----------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |               | <p>with the particles outlines.</p> <ul style="list-style-type: none"> <li>• <b>textured</b> - displays only the surface texture.</li> <li>• <b>textured+wireframe</b> - displays the wireframe plus the surface texture.</li> <li>• <b>unchanged</b> - doesn't change the particles display mode. The Viewer can override this setting.</li> </ul> |
| selectable     | selectable       | enabled       | When enabled, you can select the particles in the Viewer by clicking on them.                                                                                                                                                                                                                                                                       |
| render         | render_mode      | unchanged     | Sets how the particles will render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                                                                                                                                                                       |
| Conditions Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                     |
| probability    | probability      | 1             | Sets the probability that this node affects your particles. If you set this to zero, the node won't affect any particles, and if the value is 1, the node will affect every particle.                                                                                                                                                               |
| min age        | min_age          | 0             | Limits the effect of this node to particles above this minimum age. The age of the particle is its lifetime normalized between 0 and 1.                                                                                                                                                                                                             |
| max age        | max_age          | 1             | Limits the effect of this node to particles below this maximum age. The age of the particle is its lifetime normalized between 0 and 1.                                                                                                                                                                                                             |
| random seed    | seed             | 0             | Sets the integer to change the results of generated randomness in your particles. You can achieve slightly different effects by changing this number.                                                                                                                                                                                               |
| channels       | channels         | all           | Specifies which particle channels the effect of this node should be applied to. Channels <b>a</b> and <b>b</b> are arbitrary names for channels which are useful if you want different ParticleEmitter nodes or other particle force nodes to                                                                                                       |

| Control (UI)                                                                        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                  |               | and size depending on the points selected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| transform order | xform_order      | SRT           | Sets the operation order for scale (S), rotation (R), and translation (T). The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                                                                                                                              |
| rotation order  | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZXY, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| translate       | translate        | 0, 0, 0       | Lets you translate the region marker along the x, y, and z axes. You can also adjust translate values by clicking and dragging the axis in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                     |
| rotate          | rotate           | 0, 0, 0       | Lets you rotate the region marker around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                    |
| scale           | scaling          | 1, 1, 1       | Lets you scale the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| uniform scale   | uniform_scale    | 1             | Lets you scale the region marker simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| skew            | skew             | 0, 0, 0       | Lets you skew the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| pivot           | pivot            | 0, 0, 0       | <p>When you make changes to the region marker's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |
| Local Matrix    |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                              |
|----------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| specify matrix | useMatrix        | N/A           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                           |
| matrix         | matrix           | N/A           | <p>The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p> |

# ParticlePointForce

With ParticlePointForce, you can attract or repel particles to or from a certain point in the 3D space. You can use an animated or still axis expression-linked to the position value, or a value you have chosen to enter manually.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                 |
|-----------------|-----------------|----------------------------------------------------------|
| Input           | particles       | The particle system to which you intend to apply forces. |

| Control (UI)           | Knob (Scripting) | Default Value | Function                                                                                                                                                               |
|------------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ParticlePointForce Tab |                  |               |                                                                                                                                                                        |
| display                | display          | unchanged     | Adjust the display characteristics of the particles. These settings don't affect the render output of the scene; these are for display purposes only in the 3D Viewer. |

| Control (UI)   | Knob (Scripting) | Default Value  | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |                | <ul style="list-style-type: none"> <li>• <b>off</b> - hides the particles.</li> <li>• <b>wireframe</b> - displays only the outlines of the particle.</li> <li>• <b>solid</b> - displays all particles with a solid color.</li> <li>• <b>solid+wireframe</b> - displays the particles as solid color with the particles outlines.</li> <li>• <b>textured</b> - displays only the surface texture.</li> <li>• <b>textured+wireframe</b> - displays the wireframe plus the surface texture.</li> <li>• <b>unchanged</b> - doesn't change the particles display mode. The Viewer can override this setting.</li> </ul> |
| selectable     | selectable       | enabled        | When enabled, you can select the particles in the Viewer by clicking on them.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| render         | render_mode      | unchanged      | Sets how the particles will render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| strength       | strength         | 0              | Sets the strength of the attraction, measured in inverse square. A negative value is an attraction and a positive value is a repulsion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| falloff        | falloff          | inverse square | <p>How quickly the strength of the attraction falls off with respect to distance:</p> <ul style="list-style-type: none"> <li>• <b>none</b> - attraction or repulsion is constant, regardless of the distance from the <b>position</b> values.</li> <li>• <b>inverse</b> and <b>inverse square</b> - falloff is calculated with respect to the selected law.</li> </ul>                                                                                                                                                                                                                                             |
| radius         | radius           | 0              | The radius of influence. Particles outside the radius are ignored, particles inside will be attracted to or repelled from the chosen point position.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| position xyz   | position         | 0, 0, 0        | Sets the position of the point which attracts or repels the particles.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Conditions Tab |                  |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Control (UI)                                                                        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------------------------------------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| probability                                                                         | probability      | 1             | Sets the probability that this node affects your particles. If you set this to zero, the node won't affect any particles, and if the value is 1, the node will affect every particle.                                                                                                                                                                                                                                     |
| min age                                                                             | min_age          | 0             | Limits the effect of this node to particles above this minimum age. The age of the particle is its lifetime normalized between 0 and 1.                                                                                                                                                                                                                                                                                   |
| max age                                                                             | max_age          | 1             | Limits the effect of this node to particles below this maximum age. The age of the particle is its lifetime normalized between 0 and 1.                                                                                                                                                                                                                                                                                   |
| random seed                                                                         | seed             | 0             | Sets the integer to change the results of generated randomness in your particles. You can achieve slightly different effects by changing this number.                                                                                                                                                                                                                                                                     |
| channels                                                                            | channels         | all           | Specifies which particle channels the effect of this node should be applied to. Channels <b>a</b> and <b>b</b> are arbitrary names for channels which are useful if you want different ParticleEmitter nodes or other particle force nodes to have an effect on separate channels.                                                                                                                                        |
| Region Tab                                                                          |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                           |
| region                                                                              | region           | none          | <p>Sets the region which you want to use to confine the particle effect to. For example, if you choose a <b>sphere</b>, only particles inside that sphere shaped region will be affected by particle effects.</p> <ul style="list-style-type: none"> <li>• <b>none</b> - all particles are affected as normal.</li> <li>• <b>sphere, box, half-space, and cylinder</b> - controls the region's boundary shape.</li> </ul> |
| invert region                                                                       | region_invert    | disabled      | When enabled, particles outside the region are affected rather than those inside it.                                                                                                                                                                                                                                                                                                                                      |

The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                                                                                                          |
| rotation order                                                                    | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZXY, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                        |
| translate                                                                         | translate        | 0, 0, 0       | Lets you translate the region marker along the x, y, and z axes. You can also adjust translate values by clicking and dragging the axis in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                 |
| rotate                                                                            | rotate           | 0, 0, 0       | Lets you rotate the region marker around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                |
| scale                                                                             | scaling          | 1, 1, 1       | Lets you scale the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| uniform scale                                                                     | uniform_scale    | 1             | Lets you scale the region marker simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| skew           | skew             | 0, 0, 0       | Lets you skew the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| pivot          | pivot            | 0, 0, 0       | <p>When you make changes to the region marker's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |
| Local Matrix   |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| specify matrix | useMatrix        | N/A           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                                                                                                                                   |
| matrix         | matrix           | N/A           | <p>The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p>                                                                                                                                                                                                                                         |

# ParticleSettings

Use the **steps per frame** control in the ParticleSettings control panel to adjust how many steps of particle simulation take place per animation frame.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                  |
|-----------------|-----------------|-----------------------------------------------------------|
| Input           | particles       | The particle system for which you intend modify settings. |

| Control (UI)         | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ParticleSettings Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                 |
| steps per frame      | steps_per_frame  | 1             | <p>Sets how many steps of particle simulation take place per animation frame.</p> <p>Sometimes simulations cannot generate enough accuracy by calculating once per frame and the resulting particle movement can appear jagged. Increasing <b>steps per frame</b> causes the simulation to asses the movement of the particles multiple times per frame to smooth movement.</p> |

# ParticleSpawn

If you're looking to have your existing particles emit even more particles, you should turn to ParticleSpawn. This node emits particles from existing particles.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                         |
|-----------------|-----------------|------------------------------------------------------------------|
| Input           | particle        | The image or geometry to emit as particles - when you connect up |

| Connection Type | Connection Name | Function                                                                                            |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------|
|                 |                 | this input, another particle input is created allowing you to mix particle types.                   |
|                 | merge           | Another particle system, including another ParticleEmitter, on which to base the spawned particles. |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                |                    |               | ParticleEmitter. If your <b>rate channel</b> is less than 1 all the way through, the spawn rate lessens.                                                                                                                                                                                                                                                                                                              |
| rate variation | rate_variation     | 0             | <p>Produces a random emission variation by adding a Gaussian-distributed random number to the <b>emission rate</b> value multiplied by the <b>rate variation</b> value.</p> <p>Roughly speaking, 0 is equal to the <b>emission rate</b> and 1 is very random variation.</p>                                                                                                                                           |
| lifetime       | lifetime           | 10            | Sets the number of frames that each spawned particle exists for.                                                                                                                                                                                                                                                                                                                                                      |
| lifetime range | lifetime_variation | 0             | <p>Produces a random lifetime variation by adding a Gaussian-distributed random number to the <b>lifetime</b> value multiplied by the <b>lifetime range</b> value.</p> <p>Roughly speaking, 0 is equal to the <b>lifetime</b> and 1 is very random variation.</p>                                                                                                                                                     |
| halflife       | halflife           | 0             | <p>Sets a <b>halflife</b> causing a fraction of the spawned particles to die randomly each frame such that on average, half of the particles that existed at a given time will continue to exist after the <b>halflife</b> (in the same way as radioactive decay).</p> <p>For example, after twice the <b>halflife</b> value in frames, only a quarter of the original spawned particles will be left, and so on.</p> |
| velocity       | velocity           | 1             | Sets the speed in units per frame of the particles as they spawn.                                                                                                                                                                                                                                                                                                                                                     |
| velocity range | velocity_variation | 0             | <p>Produces a random velocity variation by adding a Gaussian-distributed random number to the <b>velocity</b> value multiplied by the <b>velocity range</b> value.</p> <p>Roughly speaking, 0 is equal to the <b>velocity</b> and 1 is very random variation.</p>                                                                                                                                                     |
| rotation       | rotation_          | 0             | Sets how quickly spawned particles spin around their                                                                                                                                                                                                                                                                                                                                                                  |

| Control (UI)            | Knob (Scripting)            | Default Value | Function                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|-----------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| velocity                | velocity                    |               | <p>local y axis in 3D space.</p> <p>The y axis points in the direction the particles were initially spawned, but then stays unchanged. You can use the <a href="#">ParticleMotionAlign</a> node to align particles along their direction of motion, or the <a href="#">ParticleLookAt</a> node to cause all particles to align in a particular direction.</p> |
| rotation velocity range | rotation_velocity_variation | 0             | <p>Produces a random rotation velocity by adding a Gaussian-distributed random number to the <b>rotation velocity</b> value multiplied by the <b>rotationvelocity range</b> value.</p> <p>Roughly speaking, 0 is equal to the <b>rotationvelocity</b> and 1 is very random variation.</p>                                                                     |
| size                    | size                        | 0.1           | <p>Sets the size of each spawned particle. If the <b>particle</b> input is geometry, the instance of that geometry at each particle is affected by this value.</p>                                                                                                                                                                                            |
| size range              | size_variation              | 0             | <p>Produces a random variation in particle size by adding a Gaussian-distributed random number to the <b>size</b> value multiplied by the <b>size range</b> value.</p> <p>Roughly speaking, 0 is equal to the <b>size</b> and 1 is very random variation.</p>                                                                                                 |
| mass                    | mass                        | 0.1           | <p>Sets the mass of each spawned particle when a force is applied, for example when using the <a href="#">ParticlePointForce</a> node.</p>                                                                                                                                                                                                                    |
| mass range              | mass_variation              | 0             | <p>Produces a random in particle mass by adding a Gaussian-distributed random number to the <b>mass</b> value multiplied by the <b>mass range</b> value.</p> <p>Roughly speaking, 0 is equal to the <b>mass</b> and 1 is very random variation.</p>                                                                                                           |
| transfer velocity       | transfer_velocity           | 1             | <p>Transfers velocity from the initial emitter to the spawned particles on a sliding scale - all inherited velocity at 1, and</p>                                                                                                                                                                                                                             |

| Control (UI)                          | Knob (Scripting)   | Default Value | Function                                                                                                                                                                                                                                                                                     |
|---------------------------------------|--------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                       |                    |               | zero inherited velocity at 0.                                                                                                                                                                                                                                                                |
| spread                                | spread             | 0             | Applies a spread to the particles - by default, a cone shape around the direction of emission.                                                                                                                                                                                               |
| conservation of mass                  | conserve_mass      | enabled       | When enabled, the mass of any spawned particle is subtracted from the originating particle. If the mass of the originating particle is zero at the end of a frame, it is deleted.                                                                                                            |
| conservation of momentum              | conserve_momentum  | enabled       | When enabled, the momentum of any spawned particle is subtracted from the momentum of the originating particle, in correspondence with Newton's third law of motion.                                                                                                                         |
| align velocity to direction of motion | velocity_direction | enabled       | <p>When enabled, spawned particles inherit the velocity from the parent particle, but the direction of motion is dictated by the ParticleSpawn controls.</p> <p>When disabled, spawned particles inherit the direction of motion from the parent particle, but with increased velocity.</p>  |
| color                                 | color              | 1             | Sets the initial color of spawned particles when the <b>particle</b> input is not connected.                                                                                                                                                                                                 |
| inherit color                         | inherit_color      | disabled      | When enabled, the spawned particle's color is taken from the originating particle. When disabled, spawned particles derive their color from the <b>particle</b> input, if connected, or the <b>color</b> control.                                                                            |
| input order                           | input_order        | randomly      | <p>Sets the order of <b>particle</b> inputs used for the representation:</p> <ul style="list-style-type: none"> <li>• <b>randomly</b> - a random input is picked for each particle emitted.</li> <li>• <b>in order</b> - the inputs are cycled through for each particle emitted.</li> </ul> |
| start at                              | start_frame_       | first         | Determines which frame a newly emitted particle's                                                                                                                                                                                                                                            |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | animation        |               | <p>representation starts from:</p> <ul style="list-style-type: none"> <li>• <b>first</b> - uses the first frame from the input for each new particle.</li> <li>• <b>in order</b> - uses successive frames for each new particle.</li> <li>• <b>current</b> - uses the frame from which the particle was emitted.</li> <li>• <b>random</b> - uses a random frame within the representation's frame range.</li> </ul> |
| limit to range  | start_wrap       | disabled      | <p>When enabled, particle start frames are forced to be within the range of the representation input. This causes the <b>start at</b> &gt; <b>in order</b> and <b>current</b> options to wrap round back to the start of the frame range once it has been exceeded, in a continuous loop.</p>                                                                                                                       |

The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                                                                                                          |
| rotation order                                                                    | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZXY, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                        |
| translate                                                                         | translate        | 0, 0, 0       | Lets you translate the region marker along the x, y, and z axes. You can also adjust translate values by clicking and dragging the axis in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                 |
| rotate                                                                            | rotate           | 0, 0, 0       | Lets you rotate the region marker around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                |
| scale                                                                             | scaling          | 1, 1, 1       | Lets you scale the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| uniform scale                                                                     | uniform_scale    | 1             | Lets you scale the region marker simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| skew                                                                              | skew             | 0, 0, 0       | Lets you skew the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| pivot                                                                             | pivot            | 0, 0, 0       | When you make changes to the region marker's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.                                                                                                   |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                              |
|----------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |               | You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.                                                                                                                                                                               |
| Local Matrix   |                  |               |                                                                                                                                                                                                                                                                                       |
| specify matrix | useMatrix        | N/A           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                           |
| matrix         | matrix           | N/A           | <p>The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p> |

# ParticleSpeedLimit

ParticleSpeedLimit restricts particles to a specified minimum and maximum speed.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                       |
|-----------------|-----------------|----------------------------------------------------------------|
| Input           | particles       | The particle system in which you intend limit particle speeds. |

| Control (UI)           | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ParticleSpeedLimit Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| display                | display          | unchanged     | <p>Adjust the display characteristics of the particles. These settings don't affect the render output of the scene; these are for display purposes only in the 3D Viewer.</p> <ul style="list-style-type: none"> <li>• <b>off</b> - hides the particles.</li> <li>• <b>wireframe</b> - displays only the outlines of the particle.</li> <li>• <b>solid</b> - displays all particles with a solid color.</li> <li>• <b>solid+wireframe</b> - displays the particles as solid color with the particles outlines.</li> <li>• <b>textured</b> - displays only the surface texture.</li> <li>• <b>textured+wireframe</b> - displays the wireframe plus the surface texture.</li> <li>• <b>unchanged</b> - doesn't change the particles display mode. The Viewer can override this setting.</li> </ul> |
| selectable             | selectable       | enabled       | When enabled, you can select the particles in the Viewer by clicking on them.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| render                 | render_mode      | unchanged     | Sets how the particles will render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| minimum                | minimum          | 0             | Sets the minimum speed at which a particle can travel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| maximum                | maximum          | 100           | Sets the maximum speed at which a particle can travel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| strength               | strength         | 1             | Sets how quickly the particles change speed toward the <b>minimum</b> and <b>maximum</b> values. A <b>strength</b> of 0 has no effect on the particles and a <b>strength</b> of 1 forces them to change speed instantly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Conditions Tab         |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| probability            | probability      | 1             | Sets the probability that this node affects your particles. If you set this to zero, the node won't affect any particles, and if the value is 1, the node will affect every particle.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| min age                | min_age          | 0             | Limits the effect of this node to particles above this                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                |
| scale                                                                             | scaling          | 1, 1, 1       | Lets you scale the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| uniform scale                                                                     | uniform_scale    | 1             | Lets you scale the region marker simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| skew                                                                              | skew             | 0, 0, 0       | Lets you skew the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pivot          | pivot            | 0, 0, 0       | <p>When you make changes to the region marker's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |
| Local Matrix   |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| specify matrix | useMatrix        | N/A           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                                                                                                                                   |

# ParticleToGeo

With ParticleToGeo, you can control particles in a simulation by channel, giving you the ability to isolate certain particles at any point in the Node Graph. For example, you might want to freeze certain particles within a simulation while allowing others to emit as normal or apply a particle effect to the particles in a single channel.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                              |
|-----------------|-----------------|-----------------------------------------------------------------------|
| Input           | particles       | The particle system for which you intend to create particle geometry. |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ParticleToGeo Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| display           | display          | unchanged     | <p>Adjust the display characteristics of the particles. These settings don't affect the render output of the scene; these are for display purposes only in the 3D Viewer.</p> <ul style="list-style-type: none"> <li>• <b>off</b> - hides the particles.</li> <li>• <b>wireframe</b> - displays only the outlines of the particle.</li> <li>• <b>solid</b> - displays all particles with a solid color.</li> <li>• <b>solid+wireframe</b> - displays the particles as solid color with the particles outlines.</li> <li>• <b>textured</b> - displays only the surface texture.</li> <li>• <b>textured+wireframe</b> - displays the wireframe plus the surface texture.</li> <li>• <b>unchanged</b> - doesn't change the particles display mode. The Viewer can override this setting.</li> </ul> |
| selectable        | selectable       | enabled       | When enabled, you can select the particles in the Viewer by clicking on them.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| render            | render_mode      | unchanged     | Sets how the particles render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| channels          | channels         | all           | Sets which particles are affected, by channel. For example, setting <b>channels</b> to <b>a</b> only affects particles emitted into the <b>a</b> channel in the ParticleEmitter node's <b>Properties</b> panel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| align mode        | align            | none          | <p>Sets the way sprite particles are aligned:</p> <ul style="list-style-type: none"> <li>• <b>none</b> - sprite particles are not aligned.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

# ParticleTurbulence

ParticleTurbulence applies noise to the particle movement, dispersing the particles in the x, y and/or z directions.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                     |
|-----------------|-----------------|--------------------------------------------------------------|
| Input           | particles       | The particle system to which you intend to apply turbulence. |

| Control (UI)           | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| pivot          | pivot            | 0, 0, 0       | <p>When you make changes to the region marker's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |
| Local Matrix   |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| specify matrix | useMatrix        | N/A           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                                                                                                                                                                                                                                                                   |
| matrix         | matrix           | N/A           | <p>The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p>                                                                                                                                                                                                                                         |

# ParticleVortex

ParticleVortex applies a circular force to the particles and attracts them to an imaginary line, thus creating a whirlpool of particles. When you connect the ParticleVortex node to your particle stream, an arrow appears in the 3D Viewer, which you can then use to determine direction and velocity of the vortex effect. The bigger and longer the arrow, the stronger the effect.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                     |
|-----------------|-----------------|--------------------------------------------------------------|
| Input           | particles       | The particle system to which you intend to apply the vortex. |

| Control (UI)       | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| display            | display          | unchanged     | <p>Adjust the display characteristics of the particles. These settings don't affect the render output of the scene; these are for display purposes only in the 3D Viewer.</p> <ul style="list-style-type: none"> <li>• <b>off</b> - hides the particles.</li> <li>• <b>wireframe</b> - displays only the outlines of the particle.</li> <li>• <b>solid</b> - displays all particles with a solid color.</li> <li>• <b>solid+wireframe</b> - displays the particles as solid color with the particles outlines.</li> <li>• <b>textured</b> - displays only the surface texture.</li> <li>• <b>textured+wireframe</b> - displays the wireframe plus the surface texture.</li> <li>• <b>unchanged</b> - doesn't change the particles display mode. The Viewer can override this setting.</li> </ul> |
| selectable         | selectable       | enabled       | When enabled, you can select the particles in the Viewer by clicking on them.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| render             | render_mode      | unchanged     | Sets how the particles will render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| parallel           | parallel         | 0             | Applies a force to particles in a direction parallel to the vector line. Negative values flow with the vector line and positive values against it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| parallel falloff   | parallel_falloff | none          | Sets which falloff law to use when calculating the effect of the force on each particle:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Control (UI)       | Knob (Scripting)   | Default Value | Function                                                                                                                                                                                                                                                                                                                                  |
|--------------------|--------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    |                    |               | <ul style="list-style-type: none"> <li>• <b>none</b> - no falloff occurs, regardless of distance from the origin.</li> <li>• <b>inverse</b> and <b>inverse square</b> - falloff is calculated with respect to the selected law.</li> </ul>                                                                                                |
| tangential         | tangential         | 0             | Applies a force to particles in a direction tangential to the vector line. Negative values produce clockwise movement around the vector line and positive values counter-clockwise.                                                                                                                                                       |
| tangential falloff | tangential_falloff | inverse       | <p>Sets which falloff law to use when calculating the effect of the force on each particle:</p> <ul style="list-style-type: none"> <li>• <b>none</b> - no falloff occurs regardless of distance from the origin.</li> <li>• <b>inverse</b> and <b>inverse square</b> - falloff is calculated with respect to the selected law.</li> </ul> |
| radial             | radial             | 0             | Applies a force which attracts particles to (positive values), or repels them from (negative values) the vector line.                                                                                                                                                                                                                     |
| radial falloff     | radial_falloff     | inverse       | <p>Sets which falloff law to use when calculating the effect of the force on each particle:</p> <ul style="list-style-type: none"> <li>• <b>none</b> - no falloff occurs regardless of distance from the origin.</li> <li>• <b>inverse</b> and <b>inverse square</b> - falloff is calculated with respect to the selected law.</li> </ul> |
| from xyz           | from               | 0, 0, 0       | <p>Sets the point of origin for the arrow on the <b>x</b>, <b>y</b>, and <b>z</b> axes.</p> <p>The arrow determines the direction and velocity of the vortex effect. The bigger and longer the arrow, the stronger the effect.</p>                                                                                                        |

|----------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |               | vortex effect. The bigger and longer the arrow, the stronger the effect.                                                                                                                                                                                                                                                                                                                                                  |
| Conditions Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                           |
| probability    | probability      | 1             | Sets the probability that this node affects your particles. If you set this to zero, the node won't affect any particles, and if the value is 1, the node will affect every particle.                                                                                                                                                                                                                                     |
| min age        | min_age          | 0             | Limits the effect of this node to particles above this minimum age. The age of the particle is its lifetime normalized between 0 and 1.                                                                                                                                                                                                                                                                                   |
| max age        | max_age          | 1             | Limits the effect of this node to particles below this maximum age. The age of the particle is its lifetime normalized between 0 and 1.                                                                                                                                                                                                                                                                                   |
| random seed    | seed             | 0             | Sets the integer to change the results of generated randomness in your particles. You can achieve slightly different effects by changing this number.                                                                                                                                                                                                                                                                     |
| channels       | channels         | all           | Specifies which particle channels the effect of this node should be applied to. Channels <b>a</b> and <b>b</b> are arbitrary names for channels which are useful if you want different ParticleEmitter nodes or other particle force nodes to have an effect on separate channels.                                                                                                                                        |
| Region Tab     |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                           |
| region         | region           | none          | <p>Sets the region which you want to use to confine the particle effect to. For example, if you choose a <b>sphere</b>, only particles inside that sphere shaped region will be affected by particle effects.</p> <ul style="list-style-type: none"> <li>• <b>none</b> - all particles are affected as normal.</li> <li>• <b>sphere, box, half-space, and cylinder</b> - controls the region's boundary shape.</li> </ul> |
| invert region  | region_invert    | disabled      | When enabled, particles outside the region are affected rather than those inside it.                                                                                                                                                                                                                                                                                                                                      |

| Control (UI)                                                                      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

# ParticleWind

With ParticleWind, you can simulate a wind blowing on the particles. When you connect the ParticleWind node to your particle stream, an arrow appears in the Viewer, which you can then use to determine direction and velocity of the wind. The bigger and longer the arrow, the stronger the wind effect.

## Inputs and Controls

| Connection Type | Connection Name | Function                                               |
|-----------------|-----------------|--------------------------------------------------------|
| Input           | particles       | The particle system to which you intend to apply wind. |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                 |                  |               | and size depending on the points selected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| transform order | xform_order      | SRT           | Sets the operation order for scale (S), rotation (R), and translation (T). The possible operation combinations are SRT, STR, RST, RTS, TSR, TRS.                                                                                                                                                                                                                                                                                                                                                                              |
| rotation order  | rot_order        | ZXY           | Sets the order of rotation. The possible axial combinations are ZXY, XYZ, XZY, YXZ, YZX, ZXY, ZYX.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| translate       | translate        | 0, 0, 0       | Lets you translate the region marker along the x, y, and z axes. You can also adjust translate values by clicking and dragging the axis in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                     |
| rotate          | rotate           | 0, 0, 0       | Lets you rotate the region marker around the x, y, and z axes. You can adjust rotate values by holding down <b>Ctrl/Cmd</b> and dragging in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                    |
| scale           | scaling          | 1, 1, 1       | Lets you scale the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| uniform scale   | uniform_scale    | 1             | Lets you scale the region marker simultaneously on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| skew            | skew             | 0, 0, 0       | Lets you skew the region marker on the x, y, and z axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| pivot           | pivot            | 0, 0, 0       | <p>When you make changes to the region marker's position, scaling, skewing, and rotation, these occur from the location of the object's origin point or pivot. The pivot x, y, and z controls allow you to offset the pivot point and move it anywhere you like - you can even move it outside of the object. Subsequent transformations applied will then occur relative to the new pivot point location.</p> <p>You can also hold down <b>Ctrl/Cmd+Alt</b> and drag the pivot point to a new location in the 3D Viewer.</p> |
| Local Matrix    |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                              |
|----------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| specify matrix | useMatrix        | N/A           | Enable this control to specify matrix values for the object you're transforming as an alternative to setting transform, scale, skew and pivot values above.                                                                                                                           |
| matrix         | matrix           | N/A           | <p>The matrix displays values from the object's transform, rotate, scale, skew, and pivot controls.</p> <p>Check <b>specify matrix</b> and copy or drag-and-drop matrix values from another object to apply those values, for example, if you wanted to align objects in a scene.</p> |

# Deep Nodes

Deep nodes deal with Deep image compositing, where each pixel can have multiple values.

## DeepColorCorrect

This is a ColorCorrect node for deep compositing. It applies the color correction to all samples at each pixel. You can use DeepColorCorrect to create a matte by setting the **gain** value for your alpha channel to 0 and setting the **offset** value to 1 in the range you want the matte for.

There are control sets for adjusting **shadows**, **midtones** and **highlights**. You can use the lookup curves on the **Ranges** tab to control these.

### Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                          |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The deep image sequence to receive the color correction. This can also be a DeepMerge node with merged deep data. |

| Control (UI)         | Knob (Scripting) | Default Value | Function                                    |
|----------------------|------------------|---------------|---------------------------------------------|
| DeepColorCorrect Tab |                  |               |                                             |
| master               |                  |               |                                             |
| saturation           | saturation       | 1             | Adjusts the saturation in the entire image. |
| contrast             | contrast         | 1             | Adjusts the contrast in the entire image.   |
| gamma                | gamma            | 1             | Adjusts the gamma in the entire image.      |

| Control (UI) | Knob (Scripting)      | Default Value | Function                                                  |
|--------------|-----------------------|---------------|-----------------------------------------------------------|
| gain         | gain                  | 1             | Adjusts the gain in the entire image.                     |
| offset       | offset                | 0             | Adjusts the offset in the entire image.                   |
| shadows      |                       |               |                                                           |
| saturation   | shadows.saturation    | 1             | Adjusts the saturation in the darkest parts of the image. |
| contrast     | shadows.contrast      | 1             | Adjusts the contrast in the darkest parts of the image.   |
| gamma        | shadows.gamma         | 1             | Adjusts the gamma in the darkest parts of the image.      |
| gain         | shadows.gain          | 1             | Adjusts the gain in the darkest parts of the image.       |
| offset       | shadows.offset        | 0             | Adjusts the offset in the darkest parts of the image.     |
| midtone      |                       |               |                                                           |
| saturation   | midtone.saturation    | 1             | Adjusts the saturation in the middle range of the image.  |
| contrast     | midtone.contrast      | 1             | Adjusts the contrast in the middle range of the image.    |
| gamma        | midtone.gamma         | 1             | Adjusts the gamma in the middle range of the image.       |
| gain         | midtone.gain          | 1             | Adjusts the gain in the middle range of the image.        |
| offset       | midtone.offset        | 0             | Adjusts the offset in the middle range of the image.      |
| highlights   |                       |               |                                                           |
| saturation   | highlights.saturation | 1             | Adjusts the saturation in the highlights of the image.    |
| contrast     | highlights.contrast   | 1             | Adjusts the contrast in the highlights of the             |

| Control (UI)    | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                           |
|-----------------|-------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                   |               | image.                                                                                                                                                                                                                             |
| gamma           | highlights.gamma  | 1             | Adjusts the gamma in the highlights of the image.                                                                                                                                                                                  |
| gain            | highlights.gain   | 1             | Adjusts the gain in the highlights of the image.                                                                                                                                                                                   |
| offset          | highlights.offset | 0             | Adjusts the offset in the highlights of the image.                                                                                                                                                                                 |
| Masking Tab     |                   |               |                                                                                                                                                                                                                                    |
| mix             | mix               | 1             | Dissolves between the original image at 0 and the full color correction at 1.                                                                                                                                                      |
| zmap A, B, C, D | zmap              | 0, 1, 1, 1    | Sets how much of the color correction to use at various depths. The x axis represents the distance from the camera, and the y axis the fraction of the color correction to use (where 0 is none and 1 is the full effect).         |
| limit_z         | limit_z           | disabled      | When enabled, allows dissolving between the original image and the full color correction depending on the depth of the samples, using the <b>zmap</b> control.                                                                     |
| Ranges Tab      |                   |               |                                                                                                                                                                                                                                    |
| test            | test              | disabled      | Lets you overlay the output with black, gray, or white to show what is considered to be in the shadows, midtones, or highlights. Green and magenta indicate a mixture of ranges.                                                   |
| curve editor    | lookup            | N/A           | You can use the <b>shadow</b> and <b>highlight</b> lookup curves to edit the range of the image that is considered to be in the shadows or highlights. You can also look up color information for the current pixel in the Viewer. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                             |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               |  <b>Warning:</b> DO NOT adjust the <b>midtone</b> curve. Midtones are always equal to 1 minus the other two curves. |
| reset        | N/A              | N/A           | Return the selected curve(s) to the default values.                                                                                                                                                  |

# DeepCrop

You can use the DeepCrop node to:

- crop deep data in front of or behind certain planes in depth, or
- crop deep images inside or outside of the crop box in the Viewer (much like the regular [Crop](#) node).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                  |
|-----------------|-----------------|-------------------------------------------------------------------------------------------|
| Input           | unnamed         | The deep image sequence to crop. This can also be a DeepMerge node with merged deep data. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                 |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------|
| DeepCrop Tab |                  |               |                                                                                                                                          |
| znear        | znear            | 1             | Sets the near depth value of the image. By default, any samples in front of this plane in depth (that is, below this value) are cropped. |
| use          | use_znear        | enabled       | Whether to crop samples below the <b>znear</b> value.                                                                                    |
| zfar         | zfar             | 2             | Sets the far depth value of the image. By default, any                                                                                   |

# DeepExpression

The DeepExpression node allows you to apply complex mathematical formulae to deep data using expressions.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                    |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The deep image sequence to which you want to apply expressions to. This can also be a DeepMerge node with merged deep data. |

| Control (UI)          | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                   |
|-----------------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DeepExpression Tab    |                  |               |                                                                                                                                                                                                                                                                                                                            |
| [variable name field] | temp_name0       | N/A           | If you need to use a long expression in several fields, you can use this row for assigning the expression temporarily to a variable. Enter the variable name here, and the expression on the right of the = sign. You can then use the variable to represent the expression in the fields below the channels.              |

# DeepFromFrames

The DeepFromFrames node copies multiple input frames from a regular 2D image to samples in a single deep frame.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                        |
|-----------------|-----------------|-----------------------------------------------------------------|
| Input           | unnamed         | The image sequence from which you want to copy the frames from. |

| Control (UI)       | Knob (Scripting) | Default Value  | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| samples            | samples          | 5              | Sets the number of frames to sample the input at.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| frame range        | range_first      | 1              | Sets the start frame for sampling the input. For example, with the default <b>samples</b> value (5) and <b>frame range</b> value (1-9) DeepFromFrames samples at frames 1, 3, 5, 7 and 9.                                                                                                                                                                                                                                                                                                                                                  |
|                    | range_last       | 9              | Sets the end frame for sampling the input. For example, with the default <b>samples</b> value (5) and <b>frame range</b> value (1-9) DeepFromFrames samples at frames 1, 3, 5, 7 and 9.                                                                                                                                                                                                                                                                                                                                                    |
| premult            | premult          | enabled        | Set whether the input needs premultiplying.<br><br>When disabled, DeepFromFrames assumes that the input is already premultiplied.                                                                                                                                                                                                                                                                                                                                                                                                          |
| split alpha mode   | alpha_mode       | multiplicative | Set how the alpha channel is split: <ul style="list-style-type: none"> <li>• <b>additive</b> - performs a straight division by the number of samples. This does not result in the original alpha values if the deep samples are flattened later on.</li> <li>• <b>multiplicative</b> - the samples are split so that each is <math>1 - \text{pow}(1 - \alpha, 1 / \text{numSamples})</math>. If the deep samples are flattened later on (for example, using <a href="#">DeepToImage</a>), the alpha values match the originals.</li> </ul> |
| zmin               | zmin             | 1              | Sets the depth at which the first sampled frame is placed. This is the front-most sample in depth.                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                            |
|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------|
| zmax         | zmax             | 2             | Sets the depth at which the last sampled frame is placed. This is the furthestmost sample in depth. |

# DeepFromImage

Using DeepFromImage you can convert a standard 2D image to a deep image with a single sample for each pixel at the depth defined by the **depth.z** channel.

## Inputs and Controls

| Connection Type | Connection Name | Function                                          |
|-----------------|-----------------|---------------------------------------------------|
| Input           | 1               | The 2D image sequence to convert to a deep image. |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                 |

| premult input     | premult          | disabled      | Set whether the input needs premultiplying.<br><br>When disabled, DeepFromImage assumes that the input is already premultiplied.                                                                                                         |
| specify z         | set_z            | disabled      | When enabled, you can use the <b>z</b> field below to manually specify the Z depth for the single sample at each pixel.<br><br>When disabled, the Z depth for the single sample at each pixel is defined by the input's depth.z channel. |
| z                 | z                | 0             | Set the Z depth value to use for the single sample at each pixel.                                                                                                                                                                        |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                 |
|--------------|------------------|---------------|--------------------------------------------------------------------------|
|              |                  |               | This control only has an effect when you have enabled <b>specify z</b> . |

# DeepMerge

DeepMerge merges samples from multiple deep images, so that each output pixel contains all of the samples from the same pixel in each input. You can also use it to **holdout** samples in the **B** input that are occluded by samples in the **A** input or **plus** overlapping samples from the **A** and **B** inputs.

## Inputs and Controls

| Connection Type | Connection Name | Function                                |
|-----------------|-----------------|-----------------------------------------|
| Input           | A, B            | The deep images that you want to merge. |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|              |                  |               | <p>You can now view the result, which is a holdout with red, green, blue, and alpha channels. Note that the output image is still a deep image.</p> <div>  <b>Note:</b> When disabled, deep samples that coincide with a holdout are removed and everything 'deeper' is also removed. </div> |

# DeepRead

The DeepRead node loads deep images from disk in two formats:

- DTEX (generated from Pixar's PhotoRealistic RenderMan® Pro Server).
- Scanline OpenEXR 3.1.6, or above (tilted OpenEXR 3.1.6, or above, files are not supported).

**Note:** In order to load DTEX files, you need to have Pixar's RenderMan Pro Server 20, or earlier, installed on your machine. You don't need a RenderMan license, however. See Nuke's [online help](#) for more information.

Unlike standard 2D images that contain a single value for each channel of each pixel, deep images contain multiple samples per pixel at varying depths. Each sample contains per-pixel information, such as color, opacity, and camera-relative depth.

See also [DeepWrite](#).

| frame        | frame_mode       | expression    | <p>By default, Nuke assumes an exact relation between the current frame processed and the frame read in. For example, at frame 15, Nuke reads in image.0015.exr. However, you can change this behavior using this control. For instance, if you have a sequence that runs from image.0500.exr to image.1000.exr, you may want to read in image.0500.exr at frame 1. You can do so in several ways:</p> <ul style="list-style-type: none"> <li>• <b>expression</b> - enter an expression in the field on the right. For example, if your clip begins from image.0500.exr and you want to place this first frame at frame 1 rather than frame 500, you can use the expression <b>frame+499</b>.</li> <li>• <b>start at</b> - enter a start frame number in the field on the right. For example, if your sequence begins from image.0500.exr and you enter 1 in the field, image0500.exr is read in at frame 1. Similarly, if you enter 100 in the field, image0500.exr is read in at frame 100.</li> <li>• <b>offset</b> - enter a constant offset in the field on the right. This constant value is added to the current frame to get the number of the frame that's read in. For example, if your clip begins from image.0500.exr and you want to place this first frame at frame 1 rather than frame 500, you can use <b>499</b> as the constant offset.</li> </ul> |
|              | frame            | N/A           | The expression, start frame, or offset you want to use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

# DeepRecolor

DeepRecolor merges:

- a standard 2D image (**color** input) and
- a deep image file that only contains opacity for each sample (**depth** input).

It spreads the color at each pixel of the **color** input across all the samples of the corresponding pixel in the **depth** input, producing a deep output image.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                 |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | color           | A standard 2D image sequence whose channels you want to copy onto a deep image. This should be an unpremultiplied image. If your input image is premultiplied, you can add an <a href="#">Unpremult</a> node between the image and the DeepRecolor node. |
|                 | depth           | A deep image to recolor.                                                                                                                                                                                                                                 |

| Control (UI)       | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                        |

# DeepSample

Use this node to sample any given pixel in a deep image. Move the **pos** indicator over pixels in the Viewer to produce deep sample information in the DeepSample control panel.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                           |
|-----------------|-----------------|------------------------------------------------------------------------------------|
| Input           | unnamed         | The deep image to sample. This can also be a DeepMerge node with merged deep data. |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                        |

# DeepToImage

You can use this node to flatten a deep image - in other words, merge all the samples in a deep image into a regular 2D image.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                            |
|-----------------|-----------------|-------------------------------------------------------------------------------------|
| Input           | unnamed         | The deep image to flatten. This can also be a DeepMerge node with merged deep data. |

| Control (UI)           | Knob (Scripting)       | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------|------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DeepToImage Tab        |                        |               |                                                                                                                                                                                                                                                                                                                                                                               |
| volumetric composition | volumetric_composition | enabled       | <p>When enabled, DeepToImage calculates both the front and back depths of each sample.</p> <p>When disabled, DeepToImage only calculates the front depth of each sample and assumes the samples do not overlap. The calculation takes less time, but if you have overlapping samples in your deep image, the resulting image might not represent every pixel as expected.</p> |

# DeepToPoints

You can use this node to transform the deep pixel samples into points in 3D space that you can see in Nuke's 3D view, like a point cloud. This node is useful for position reference.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                               |
|-----------------|-----------------|----------------------------------------------------------------------------------------|
| Input           | camera          | An optional camera through which you can look at the point cloud.                      |
|                 | deep            | The deep image to view in 3D. This can also be a DeepMerge node with merged deep data. |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DeepToPoints Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| display          | display          | solid         | The display type for the point cloud: <ul style="list-style-type: none"> <li>• <b>off</b> - hides the points.</li> <li>• <b>wireframe</b> - displays only the outlines of the points.</li> <li>• <b>solid</b> - displays all points with a solid color.</li> <li>• <b>solid+wireframe</b> - displays the points as solid color with their outlines.</li> <li>• <b>textured</b> - displays the only the surface texture.</li> <li>• <b>textured+wireframe</b> - displays the wireframe plus the surface texture.</li> </ul> |
| selectable       | selectable       | enabled       | When enabled, you can select the points in the Viewer by clicking on them.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| render           | render_mode      | solid         | Sets how the points will render. This control is independent from the <b>display</b> selection, but has the same settings.                                                                                                                                                                                                                                                                                                                                                                                                 |

| Control (UI) | Knob (Scripting) | Default Value | Function                             |
|--------------|------------------|---------------|--------------------------------------|
| Point detail | detail           | 0.25          | Sets the density of the point cloud. |
| Point size   | pointSize        | 2             | Sets the size of the points.         |

# DeepTransform

You can use this node to reposition deep data. It allows you to:

- translate the samples along the x, y, and z axes, and
- scale the samples' Z depth values.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------------|
| Input           | mask            | An optional image to use as a mask. The z translate and z scale effects are limited to the non-black areas of the mask. |
|                 | deep            | The deep image to transform. This can also be a DeepMerge node with merged deep data.                                   |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                |
|-------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------|
| DeepTransform Tab |                  |               |                                                                                                                         |
| translate x, y, z | translate        | 0, 0, 0       | Moves all samples at each pixel along the x, y, and z axes.                                                             |
| zscale            | zscale           | 1             | Scales the z depth of all samples at each pixel. Values above 1 decrease the depth, whereas values below 1 increase it. |
| mask              | N/A              | enabled       | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel            |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                              |
|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------|
|              |                  |               | to <b>none</b> .                                                                                                      |
|              | mask_channel     | rgba.alpha    | The channel to use as a mask. The z translate and z scale effects are limited to the non-black areas of this channel. |

# DeepWrite

This node renders the result of all upstream deep nodes and saves the result to disk in the scanline OpenEXR 3.1.6 format (tiled OpenEXR files are not supported).

Note that this node executes all renders at the currently active scale: either full- or proxy-resolution. To toggle between these, press **Ctrl/Cmd+P**.

See also [DeepRead](#).

## Inputs and Controls

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                  |
|---------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DeepWrite Tab |                  |               |                                                                                                                                                                                           |
| channels      | channels         | rgba          | Sets the channels to render.<br><br>If you set this to something other than <b>all</b> or <b>none</b> , you can use the controls on the right to select individual channels.              |
| file          | file             | none          | Sets the file path and name of the file to render.                                                                                                                                        |
| proxy         | proxy            | none          | Sets the file path and name of a relevant proxy image. This proxy image is used if <b>proxy</b> mode is on and the required resolution is less than or equal to the <b>proxy format</b> . |
| frame         | frame_mode       | expression    | Sets the frame mode:                                                                                                                                                                      |

|--------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | <ul style="list-style-type: none"> <li>• <b>expression</b> - Lets you enter an expression in the field on the right. The expression changes the relation between the currently processed frame and the numbering of the frame written out. The resulting file name for the current frame is displayed on the DeepWrite node in the Node Graph. For example, if your deep clip begins from frame 500 and you want to name that frame image.0001.exr rather than image.0500.exr, you can use the expression <b>frame-499</b>. This way, 499 frames are subtracted from the current frame to get the number for the frame written out. Frame 500 is written out as image.0001.exr, frame 501 is written out as image.0002.exr, and so on. Another example of an expression is <b>frame*2</b>. This expression multiplies the current frame by two to get the number of the frame that's written out. At frame 1, image.0002.exr is written out; at frame 2, image.0004.exr is written out; at frame 3, image.0006.exr is written out; and so on.</li> <li>• <b>startat</b> - Lets you enter a start frame number in the field on the right. This specifies the frame number given to the first frame in the sequence. The numbering of the rest of the frames is offset accordingly. For example, if your sequence begins from frame 500 and you enter <b>1</b> in the field, frame 500 is written out as image.0001.exr, frame 501 as image.0002.exr, and so on. Similarly, if you enter <b>100</b> in the field, frame 500 is written out as image.0100.exr.</li> <li>• <b>offset</b> - Lets you enter a constant offset in the field on the right. This constant value is added to the current frame to get the number for the frame that's written out. For example, if your clip begins from frame 500 and you want to render this first</li> </ul> |

# Views Nodes

Views nodes deal with stereoscopic or multi-view compositing.

## Anaglyph

If you’re working on a stereoscopic or multi-view project, you can use this node to convert your input into an anaglyph image. By default, the left input is filtered to remove blue and green, and the right view to remove red.

Anaglyph images produce a 3D effect when viewed with two-color anaglyph glasses.

See also [MixViews](#) and [SideBySide](#).

### Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Anaglyph Tab      |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                         |
| views             | views            | N/A           | The views to use for the left and the right eye.                                                                                                                                                                                                                                                                                                                                                                        |
| amtcolor          | amtcolour        | 0             | <p>By default, Anaglyph converts the input images into grayscale images. To add color into the images, select a value between 0 (grayscale) and 1 (colored) here.</p> <div>  <b>Note:</b> If the images include areas that are very red, green, or blue, adding more color into them may not produce the best possible results. </div> |
| (right=red)       | swap             | disabled      | When enabled, the colors are inverted so that the red channel is used from the right input and the blue and green channels from the left.                                                                                                                                                                                                                                                                               |
| horizontal offset | offset           | 0             | Sets where the images appear in relation to the screen when viewed with anaglyph glasses. To have the images appear in front of the screen, you would usually enter a negative value. To have the images appear further away, you would usually enter a positive value. (This is not the case if you have swapped the left and right views around.)                                                                     |

# JoinViews

If you have separate files for the views that exist in your **Project Settings** (for example, one file for the left view and another for the right), JoinViews lets you combine these files into a single output. This can be useful if:

- You want to perform the same actions on all views. By default, Nuke applies any changes you make to all views of the processed node.
- Your subsequent nodes (for example, [Split and Join](#)) require a single input that contains two views.

See also [Split and Join](#) and [OneView](#).

## Inputs and Controls

| Connection Type | Connection Name                                                          | Function                                                 |
|-----------------|--------------------------------------------------------------------------|----------------------------------------------------------|
| Input           | There's one input for each view defined in the <b>Project Settings</b> . | The views that you want to combine into a single output. |

## MixViews

If you're working on a stereoscopic or multi-view project, you can use this node to display a blend between two views in the Viewer. This allows you to check how elements in these views are aligned.

See also [Anaglyph](#) and [SideBySide](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                   |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| views        | views            | N/A           | The two views to blend between.                                                                                                                                            |
| mix          | mix              | 0             | Adjust the blend between the views. Setting this to 0 or 1 displays only one of the views. Values between 0 and 1 produce a gradual transition from one view to the other. |

# OneView

OneView lets you separate one view for processing. This is useful if you need to perform different actions on different views, for example if you want to color correct one view but not the other. Any changes you make using subsequent nodes are only applied to the extracted view (regardless of what view you are displaying in the Viewer).

If you want to perform the same action on both views but use different values for each, you can split the view off in the node's controls instead.

To merge the views back together further down the node tree, use the [JoinViews](#) node.

See also [Split and Join](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                              |
|-----------------|-----------------|-----------------------------------------------------------------------|
| Input           | unnamed         | The image that contains the view you want to separate for processing. |

| Control (UI) | Knob (Scripting) | Default Value | Function             |
|--------------|------------------|---------------|----------------------|
| OneView Tab  |                  |               |                      |
| view         | view             | N/A           | The view to extract. |

# ReConverge

If you're working on a stereoscopic or multi-view project, the ReConverge node lets you shift convergence (the inward rotation of the eyes or cameras) so that any selected point in the image appears at screen depth when viewed with 3D glasses. This point is called the **convergence point**. It is the point where the lines of sight from the two cameras meet.

At the convergence point, the different views in the image are aligned and appear at screen depth when viewed with 3D glasses. Anything behind the convergence point appears behind the screen, while anything in front of it seems to pop out of the screen.

To calculate the convergence shift, the ReConverge node needs a disparity field that maps the location of a pixel in one view to the location of its corresponding pixel in the other view. To create the disparity field, you can use O\_DisparityGenerator plug-in, which is part of the Ocula plug-in set. Alternatively, you can create the disparity field in a 3D application. Once you have the disparity field, you can store it in the channels of an .exr file, or use the [Shuffle](#) node to add the disparity channels in the data stream where you need them.

It is also possible to use the same element as the convergence point throughout the image sequence. To do so, link the ReConverge node with a [Tracker](#) node.

To better view the effect of the ReConverge node, you can insert an [Anaglyph](#) node between the ReConverge node and the Viewer.

**Note:** The ReConverge node only shifts views horizontally, not vertically.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                              |

| Converge upon xy   | convergencepoint | 0, 0          | <p>The x and y coordinates of the convergence point (the point you want to appear at screen level when viewed with 3D glasses).</p> <p>You can also move the point by dragging the convergence point overlay in the Viewer.</p>                            |
| Convergence offset | offset           | 0             | Adjusts the offset for convergence (in pixels). To bring all elements of your image forward from the screen level, enter a positive value. To move all elements further away, enter a negative value.                                                      |
| Mode               | convergemode     | shift right   | <p>The view to move to achieve the convergence shift:</p> <ul style="list-style-type: none"> <li>• <b>shift right</b> - move the right view.</li> <li>• <b>shift left</b> - move the left view.</li> <li>• <b>shift both</b> - move both views.</li> </ul> |

# ShuffleViews

You can use this node to rearrange the views in your script. For example, you can swap the left and right views around in the pipeline, so that Nuke uses the left input for the right eye and vice versa.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                 |
|-----------------|-----------------|----------------------------------------------------------|
| Input           | unnamed         | The image that contains the views you want to rearrange. |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| views to use     | views            | N/A           | <ol style="list-style-type: none"> <li>1. Click <b>add</b> to add rows of controls to the control panel, or <b>delete</b> to remove unnecessary rows.</li> <li>2. Use the buttons or dropdown menus to select which view to replace with which. For example, to swap the left and right views around, you need to make the following selections: <ul style="list-style-type: none"> <li>• On one row, select left under <b>get</b>, and right under <b>from</b> ("get left from right"). The left view is now replaced with the right view.</li> <li>• On another row, select right under <b>get</b>, and left under <b>from</b> ("get right from left").</li> </ul> </li> </ol> |

## SideBySide

If you're working on a stereoscopic or multi-view project, you can use this node to display two views next to each other in the Viewer.

See also [Anaglyph](#) and [MixViews](#).

## Inputs and Controls

## Split and Join

Split and Join is a combination of [OneView](#) and [JoinViews](#) nodes. It allows you to extract all the views in your **Project Settings**, process them individually, and then merge them back together. It's no different to using several OneView nodes together with a JoinViews node, but it makes working faster because you do not need to add each node separately.

Once you've used Split and Join, you can add any necessary nodes, such as color corrections, between the OneView and JoinViews nodes.

# Metadata Nodes

Metadata nodes deal with information embedded in your images, such as the image's original bit depth, width, and height.

## AddTimeCode

Adds a time code to the metadata passed down from an input node. The default settings add the time code 01:00:00:00 to the first frame. This time code is updated throughout the frame range according to the input clip's playback speed, which in turn is controlled by the **fps** (frames per second) control in the **Project Settings**. If you change the **fps** value in the **Project Settings**, the time code in the metadata is updated to reflect the change.

### Inputs and Controls

| Connection Type | Connection Name | Function                                       |
|-----------------|-----------------|------------------------------------------------|
| Input           | unnamed         | The node to receive the time code information. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                           |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TimeCode Tab |                  |               |                                                                                                                                                                                    |
| startcode    | startcode        | 01:00:00:00   | Enter the time code value to add to the first frame of the input.                                                                                                                  |
| fps          | fps              | 24            | If you want to specify the playback speed manually rather than get it from the <b>Project Settings</b> , disable <b>get FPS from metadata</b> and enter a new value in this field. |
| get FPS      | metafps          | enabled       | By default, frames per second is read from the input's                                                                                                                             |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                        |
|------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| from metadata    |                  |               | playback speed, which is controlled by the <b>Project Settings</b> . If you want to override the value in the input, disable this control and enter the required value in the <b>fps</b> field. |
| start frame      | frame            | 1             | If you want to specify a different start frame than the first frame, enable <b>use start frame?</b> and enter a new value in this field.                                                        |
| use start frame? | useFrame         | disabled      | By default, the start frame is always 1. If you want to override this value, enable this control and enter the required frame in the <b>start frame</b> field.                                  |

# CompareMetaData

Connecting nodes to the CompareMetaData node enables you to quickly determine metadata differences between files. The CompareMetaData node only shows keys and values where there are differences between the two inputs. For example, if you were having trouble with QuickTime frame rates, you could connect up two QuickTime files and immediately see differences between the **input/frame\_rate** key values.

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | A               | The first node whose metadata you want to compare.  |
|                 | B               | The second node whose metadata you want to compare. |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                |
|---------------------|------------------|---------------|-----------------------------------------------------------------------------------------|
| CompareMetaData Tab |                  |               |                                                                                         |
| metadata viewer     | metadata         | N/A           | Displays the differences between the metadata of any two nodes connected to the inputs. |

# CopyMetaData

This node copies metadata from one image to another, filtering the metadata to exclude some keys if required.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                |
|-----------------|-----------------|---------------------------------------------------------|
| Input           | Meta            | The node whose metadata you want to copy to the output. |
|                 | Image           | The node whose image you want to pass down the tree.    |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| metadata viewer    | metadata         | N/A           | <ol style="list-style-type: none"> <li>1. First add, remove, and reorder metadata placemarkers using the +/- and up/down arrow buttons.</li> <li>2. Double-click the <b>key</b> field in the placemaker to select the metadata you want to edit or remove. The <b>Pick metadata key</b> dialog opens. If you want to add metadata, simply enter a new key name in the field at the bottom of this dialog.</li> <li>3. Double-click the <b>action</b> field in the placemaker to toggle the operation between <b>set</b> and <b>remove</b>.</li> <li>4. If you want to add or edit metadata, double-click the <b>value</b> field in the placemaker and enter a new value for the selected key.</li> </ol> |

# ViewMetaData

ViewMetaData lets you inspect metadata (such as the image's original bit depth, width, and height) passed down by an input node. The data is split into two columns, **keys** and the **values** associated with them.

## Inputs and Controls

| Connection Type | Connection Name | Function                                     |
|-----------------|-----------------|----------------------------------------------|
| Input           | unnamed         | The node whose metadata you want to inspect. |

| Control (UI)        | Knob (Scripting)   | Default Value   | Function                                                                                                                                                                                                                                                                                                                                |
|---------------------|--------------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ViewMetaData Tab    |                    |                 |                                                                                                                                                                                                                                                                                                                                         |
| metadata viewer     | shownmetadata      | N/A             | Displays the metadata of any node connected to the input. Once you know which keys exist on the input, you can reference them in expressions.<br><br>The metadata displayed depends on input file type. For example, a JPEG might only contain <b>input/</b> keys, whereas QuickTimes contain <b>input/</b> and <b>quicktime/</b> keys. |
| search metadata for | metadatafilter     | N/A             | Filter the metadata by entering text in this field. By default, only metadata containing the <b>keys</b> and <b>values</b> entered are displayed. You can change this behavior using the <b>within</b> control.                                                                                                                         |
| within              | metadatafiltermode | keys and values | Defines how to filter the search metadata for control. You can search <b>keysandvalues</b> , <b>keysonly</b> , or <b>valuesonly</b> .                                                                                                                                                                                                   |

# ToolSets Nodes

Tool sets deal with custom tools created in Nuke. You can create your own ToolSets from scratch or modify the existing 2D and 3D examples that ship with Nuke. The example scripts also contain a link to footage you can download to use with the examples:

[http://thefoundry.s3.amazonaws.com/products/nuke/toolsets/toolset\\_examples.zip](http://thefoundry.s3.amazonaws.com/products/nuke/toolsets/toolset_examples.zip)

## 2D ToolSets

Nuke ships with the following 2D ToolSets:

| ToolSet      | Description                                                                                                                                                                                                                                                                                                         | Result                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| CG_Beauty    |                                                                                                                                                                                                                                                                                                                     |                                                                                      |
| TB_CG_Beauty | A basic approach to splitting out and merging back together several layers from multi-channel EXRs using some common third-party renderers, such as Arnold, Modo, and RenderMan.                                                                                                                                    |   |
| Keying       |                                                                                                                                                                                                                                                                                                                     |                                                                                      |
| TK_Keying    | An example of combining different keys from blue or greenscreen footage to produce a better matte. This ToolSet creates a key for the edges of the alpha channel, ignoring fine detail, and then combines it with a hard, core matte. Finally the edges are keyed separately, masked, and combined with the result. |  |

| ToolSet             | Description                                                                                                                                                                                             | Result                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| SmartPaint          |                                                                                                                                                                                                         |                                                                                      |
| TSVSmartVectorFix   | An example of rendering vectors for a plate and then using VectorDistort to warp the source. An example image is then merged on top of the source.                                                      |    |
| TSVSmartVectorGrade | An example of rendering vectors for a plate and then using VectorDistort to warp a black and white mask over the source. The warped mask is then used to grade the original plate.                      |    |
| TSVSmartVectorSTMap | An example of writing the results of a SmartVector to disk as an STMap sequence to save processing time. This STMap can then be used throughout the shot as needed, rather than recalculating the warp. |  |

## 3D ToolSets

Nuke ships with the following 3D ToolSets:

| ToolSet   | Description | Result |
|-----------|-------------|--------|
| Particles |             |        |

| ToolSet    | Description                                                                                                                                                                                                                                                                                  | Result                                                                               |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| P_DustHit  | <p>Creates an adjustable dust particle system. Double-click the particle system to open its <b>Properties</b> panel and then click the <b>S</b> icon to display the contents of the group.</p> <p>The image shows the 3D particle system rendered through a ScanlineRender node.</p>         |    |
| P_FogBox   | <p>Creates an adjustable fog particle system. Double-click the particle system to open its <b>Properties</b> panel and then click the <b>S</b> icon to display the contents of the group.</p> <p>The image shows the 3D particle system rendered through a ScanlineRender node.</p>          |   |
| P_SnowRain | <p>Creates an adjustable snow or rain particle system. Double-click the particle system to open its <b>Properties</b> panel and then click the <b>S</b> icon to display the contents of the group.</p> <p>The image shows the 3D particle system rendered through a ScanlineRender node.</p> |  |

| ToolSet                    | Description                                                                                                                                                                                                                                                                     | Result                                                                                                                                                                                                                                                                                                                       |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| P_Sparks                   | <p>Creates an adjustable trail of sparks. Double-click the particle system to open its <b>Properties</b> panel and then click the <b>S</b> icon to display the contents of the group.</p> <p>The image shows the 3D particle system rendered through a ScanlineRender node.</p> |  A black and white image showing a trail of sparks. The sparks are represented as a series of small, bright, glowing spheres arranged in a curved, upward-sloping path against a dark background.                                          |
| P_Trail                    | <p>Creates an adjustable comet effect. Double-click the particle system to open its <b>Properties</b> panel and then click the <b>S</b> icon to display the contents of the group.</p> <p>The image shows the 3D particle system rendered through a ScanlineRender node.</p>    |  A black and white image showing a comet effect. It features a large, bright, glowing sphere on the left, with a long, diffuse, and slightly curved trail of smaller, glowing particles extending to the right against a dark background. |
| Projection and Rig Removal |                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                              |
| TP_RRCleanProject          | <p>An example showing painting out the rig on a single frame, projecting the paint onto 3D geometry and rendering it through the moving scene camera, and then merging the correction back over the source plate.</p>                                                           |  A color image of a desert landscape. A paved road stretches from the foreground into the distance, flanked by dry, scrubby vegetation. In the far distance, a small red car is visible on the road. The sky is clear and blue.          |
| TP_RRCleanTexture          | <p>An example showing projecting a single frame through a static camera onto geometry,</p>                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                              |

| ToolSet              | Description                                                                                                                                                                                                                            | Result |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|
|                      | 'unprojecting' that frame to the geometry's UV space to remove perspective, painting the correction and reapplying it to the geometry through the moving scene camera. The correction is then merged back over the source plate.       |        |
| TP_RRExistingProject | An example showing projecting an existing clean frame through a camera onto 3D geometry, rendering it through the moving scene camera, and then merging the correction back over the source plate.                                     |        |
| TP_RRExistingTexture | An example applying a pre-existing clean texture to 3D geometry, rendering it through the moving scene camera, and then merging the texture back over the source plate.                                                                |        |
| TP_RRPlanarTrack     | An example showing creating a cleaned frame using a RotoPaint node, tracking a plane using the Roto node's <b>Tracking</b> tab, and then using the resultant CornerPin node to track this frame into place across the entire sequence. |        |
| Relighting           |                                                                                                                                                                                                                                        |        |

| ToolSet       | Description                                                                                                                                         | Result                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| TR_Relighting | An example script showing the creation of a point cloud from a position pass, which is then used to relight the 2D image from 3D light information. |  |

## Create

Creates a node tool set in the Nuke toolbar. This can be useful if you find yourself creating the same set of nodes repeatedly. Once you have created a tool set, you can easily create the nodes that it contains by selecting it in the **ToolSets** menu (rather than creating each node separately).

To create a tool set, select the nodes you want to include in the Node Graph and click **ToolSets > Create**. In the **Create ToolSet** dialog that appears, use the **ToolSets menu** to select the menu where you'd like to place your new tool set. Then give it a name in the **Menu item** field and click **Create**.

By default, your new tool set goes under the **ToolSets** menu, but if you'd like to create a subfolder for the tool set, you can do that by specifying the folder name before the tool set name, separated by a forward slash, in the **Menu item** field. For example, entering **Roto/BasicRoto** would create a subfolder called **Roto** in the **ToolSets** menu, and place a new tool set by the name of BasicRoto in it.

Like gizmos, tool sets can be shared between artists if they are using a centralized .nuke folder. This needs to be accessed through a NUKE\_PATH environment variable that you can set up.

See also [Delete](#).

## Delete

Allows you to delete a tool set you've created earlier. Simply click **ToolSets > Delete** in the toolbar and select the tool set you want to remove. A dialog displays asking you to confirm the removal. Click **Yes**.

See also [Create](#).

# Other Nodes

Other nodes contain additional nodes for script and Viewer management.

## Assert

You can use this node to test the validity of a Tcl expression. If the expression resolves to false, this node raises an error.

The Assert node does not alter the input image in any way.

For more information on Tcl expressions, see Nuke's [online help](#) or select **Help > Documentation > Knob Math Expressions** in Nuke.

## AudioRead

You can use this node to read in an audio file and view it in the Curve Editor and Dope Sheet in order to line up keyframes of your composition with the waveform of the sound. You can then flipbook the audio with your footage to preview your comp with sound.

### Inputs and Controls

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                              |
|---------------|------------------|---------------|-------------------------------------------------------------------------------------------------------|
| AudioRead Tab |                  |               |                                                                                                       |
| file          | file             | N/A           | Sets the file path of the audio file you're reading in. This can be an uncompressed WAV or AIFF file. |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                              |
|-----------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| time range      | begintime        | 0, 0          | Sets the start and end times for the audio in Nuke.                                                                                                                   |
| file time range | filebegintime    | 0, 0          | Sets the start and end times of the audio file read in. These are automatically set to the values in the file, but you can change them to trim the data used in Nuke. |
| reload          | reload           | N/A           | Click to refresh the read buffer.                                                                                                                                     |
| ratesource      | ratesource       | file          | Sets the source for the sample rate. File reads the rate from the audio file, custom lets you specify a custom rate in the rate field.                                |
| rate            | rate             |               | Sets the sample rate of the audio clip.                                                                                                                               |
| curves          |                  |               |                                                                                                                                                                       |
| left            | left             | 0             | Adjusts the left level on the current frame.                                                                                                                          |
| right           | right            | 0             | Adjusts the right level on the current frame.                                                                                                                         |
| key interval    | keyinterval      | 0             | Sets the key interval you want to use when creating the curves.                                                                                                       |
| generate        | generate         | N/A           | Click to generate the audio data as a curve that you can use in the Curve Editor and Dope Sheet.                                                                      |

# Backdrop

This node visually groups nodes in the Node Graph. Inserting a Backdrop node creates a box behind the nodes. When you move the box, all the nodes that overlap the box are moved too. By inserting several Backdrop nodes, you can group the nodes in your node tree onto boxes of different colors and titles. This makes it easier to find a particular node in a large node tree, for example.

You can also use the **Z Order** control in the **Properties** panel to layer-up Backdrop nodes. Backdrops with lower **Z Order** values appear underneath those with a higher value.

See also [StickyNote](#).

# BlinkScript

The BlinkScript node runs Foundry's Blink framework enabling us to write our code once and run it on any supported device. This is achieved through code translation, in which the Blink code is turned into specific code for each target device. Code is generated and compiled on-the-fly, allowing you to switch between devices at will.

BlinkScript runs a Blink "kernel" over every pixel in the output, where a Blink kernel is similar to a C++ class, but with some special parameter types and functions. Through translation, the code in the BlinkScript node can be turned into normal C++ or SIMD code for the CPU, or OpenCL for the GPU.

The Blink framework streamlines plug-in development workflow significantly, as you no longer have to exit Nuke to compile your code.

**Note:** To use the GPU when rendering from the command line, add `--gpu` to your command. For more information on GPU support, see the [Release Notes](#) for your version of Nuke.

You can publish kernels in Group nodes which can then be saved as gizmos, if required. Published kernels can be encoded to protect your IP using BlinkScript's built-in kernel protection. Protected kernels are not readable when the published node is saved to a script.

**Warning:** BlinkScript is very flexible, as there are no restrictions on the code you can write within a kernel. As a result, code compiled from the Kernel Source can cause Nuke to crash, so please use caution!

## Inputs and Controls

| Connection Type | Connection Name | Function                                              |
|-----------------|-----------------|-------------------------------------------------------|
| Input           | src             | The image to which the BlinkScript kernel is applied. |

| Control (UI)          | Knob (Scripting)       | Default Value    | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|------------------------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BlinkScript Tab       |                        |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Kernel File           | kernelSourceFile       | none             | Sets the file path of the kernel used for <b>Load</b> and <b>Save</b> operations. BlinkScript kernels use the <b>.rpp</b> file extension.                                                                                                                                                                                                                                                                                                                                                         |
| Load                  | reloadKernelSourceFile | N/A              | Click to load and compile the kernel specified in the <b>Kernel File</b> field.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Save                  | saveKernelFile         | N/A              | Click to save the current kernel to the location and file name specified in the <b>Kernel File</b> field.                                                                                                                                                                                                                                                                                                                                                                                         |
| Clear                 | clearKernelSource      | N/A              | Click to clear the Kernel Editor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Recompile             | recompile              | N/A              | Click to recompile the kernel currently in the Kernel Editor. Any compile errors present are displayed on screen.                                                                                                                                                                                                                                                                                                                                                                                 |

# BurnIn

The BurnIn node allows you to add text to certain areas of your footage quickly, without relying on the Text node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                   |
|-----------------|-----------------|--------------------------------------------|
| Input           | 1               | The image to which the burn-in is applied. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                    |
|--------------|------------------|---------------|-----------------------------------------------------------------------------|
| BurnIn Tab   |                  |               |                                                                             |
| color        | burnIn_color     | 1             | Sets the color of the burn-in text.                                         |
| opacity      | burnIn_opacity   | 1             | Sets the opacity of the burn-in text.                                       |
| x-padding    | burnIn_xpadding  | 30            | Controls the position of the burn-in fields on the x and y axes, in pixels. |
| y-padding    | burnIn_yPadding  | 30            |                                                                             |
| font         | font family      | Utopia        | Sets the burn-in font and style.                                            |
|              | font style       | Regular       |                                                                             |
| text scale   | burnIn_textScale | 0.5           | Sets the size of the burn-in text.                                          |

| Control (UI)   | Knob (Scripting)         | Default Value           | Function                                                                                                                                                          |
|----------------|--------------------------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| top left       | burnIn_topLeft           | hiero/clip              | Determines the metadata used to create the burn-in text in the six positions listed.<br><br>Setting a dropdown to <b>none</b> removes burn-in from that position. |
| top middle     | burnIn_topMiddle         | hiero/sequence          |                                                                                                                                                                   |
| top right      | burnIn_topRight          | hiero/shot              |                                                                                                                                                                   |
| bottom left    | burnIn_bottomLeft        | hiero/track             |                                                                                                                                                                   |
| bottom middle  | burnIn_bottomMiddle      | hiero/project           |                                                                                                                                                                   |
| bottom right   | burnIn_bottomRight       | hiero/sequence/timecode |                                                                                                                                                                   |
| Background Tab |                          |                         |                                                                                                                                                                   |
| enable         | burnIn_backgroundEnable  | disabled                | When enabled, the burn-in text has a background determined by the <b>color</b> , <b>opacity</b> , and <b>border</b> controls.                                     |
| color          | burnIn_backgroundColor   | 0,0,0,1                 | Sets the color of the burn-in background.                                                                                                                         |
| opacity        | burnIn_backgroundOpacity | 1                       | Sets the opacity of the burn-in background.                                                                                                                       |
| x-border       | burnIn_backgroundXBorder | 10                      | Controls the width and height of the burn-in background, in pixels.                                                                                               |
| y-border       | burnIn_backgroundYBorder | 5                       |                                                                                                                                                                   |

# DiskCache

DiskCache caches to disk scanlines from its input as they are requested by its output. It does this at full 32-bit floating point. This allows Nuke to reference the cached data instead of constantly recalculating the output of the preceding nodes.

By default, DiskCache caches the selected channels of the current frame at the current zoom level.

DiskCache can be useful, for example, if:

- you are working on a large, complex node tree. Using the DiskCache node, you can break the node tree into smaller sections and cache any branches that you are no longer working on.
- you are reading in images from a network. If you insert a DiskCache node after a Read node, the image will be cached locally and displayed faster.
- you are painting or rotoscoping. If you insert a DiskCache node before a RotoPaint node, flipping frames becomes faster.

The cached images are saved in the same directory as the images the Nuke Viewer caches automatically. You can set the location and size of this directory in the Preferences. A large, fast local disk is DiskCache's best friend.

If you make a change in the nodes upstream, the affected cached images are discarded and automatically recalculated.

## Inputs and Controls

| Connection Type | Connection Name | Function                        |
|-----------------|-----------------|---------------------------------|
| Input           | unnamed         | The node tree to cache locally. |

| Control (UI)                                                                                                                                           | Knob (Scripting) | Default Value | Function                                                                                                     |
|--------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------|
| DiskCache Tab                                                                                                                                          |                  |               |                                                                                                              |
| channels                                                                                                                                               | channels         | all           | Sets the channels to cache from the current frame at the current zoom level.                                 |
| Precache                                                                                                                                               | Precache         | n/a           | Click to force all lines in the frame to be calculated and cached.                                           |
| Python Tab (These controls are for Python callbacks and can be used to have Python functions automatically called when various events happen in Nuke.) |                  |               |                                                                                                              |
| before render                                                                                                                                          | beforeRender     | none          | These functions run prior to starting rendering in execute(). If they throw an exception, the render aborts. |

| Control (UI)      | Knob (Scripting)  | Default Value | Function                                                                                                                                             |
|-------------------|-------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| before each frame | beforeFrameRender | none          | These functions run prior to starting rendering of each individual frame. If they throw an exception, the render aborts.                             |
| after each frame  | afterFrameRender  | none          | These functions run after each frame is finished rendering. They are not called if the render aborts. If they throw an exception, the render aborts. |
| after render      | afterRender       | none          | These functions run after rendering of all frames is finished. If they throw an error, the render aborts.                                            |
| render progress   | renderProgress    | none          | These functions run during rendering to determine progress or failure.                                                                               |

# Dot

You can use the Dot node to make bends in the connecting arrows between other nodes. This can help you keep your script easy to read.

The Dot node does not alter the input image in any way.

You can also create this node by pressing . (period) on the Node Graph.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                       |
|-----------------|-----------------|--------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence after which you want to add a bend in the connecting arrow. |

# Group

You can use the Group node to nest multiple nodes inside a single node. The original nodes are replaced with the Group node. When you create a Group node, its internal structure is shown in a separate Node Graph that opens.

You can also create this node by pressing **Ctrl/Cmd+G** on the Node Graph.

See also [Precomp](#), [VariableGroup](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                              |
|-----------------|-----------------|---------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to which you want to apply the nodes nested inside the Group node. |

|  | N/A              | N/A           | Shows the internal structure of the Group node in a separate Node Graph. This can be useful if you want to see what the Group does or ungroup the nodes nested inside it.                                                                                                                                                                                                                                                                                                                   |
| export as gizmo...                                                                  | N/A              | N/A           | Exports the group of nodes as a gizmo that can be reused by other artists. Gizmos are saved in a separate .gizmo file in your Nuke plug-in folder. Nuke scripts can use gizmos just like any other node type. Saved scripts only contain the name and control settings for the gizmo; the definition is in the gizmo file and it is read at the same time the script is loaded into Nuke. Thus, you can alter the implementation of the gizmo and change all the scripts that are using it. |

| Control (UI)         | Knob (Scripting) | Default Value | Function                                                                                                             |
|----------------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------|
| lock all connections | lock_connections | disabled      | When enabled, the connections between the grouped nodes are locked so that they cannot be accidentally disconnected. |

# Input

Adds an input arrow to a [Group](#) node. This allows you to add multiple inputs to your Group or gizmo (for example a main input and a mask input). By default, the inputs are numbered, but if you want to name them, you can do so by renaming the Input nodes.

Note that you should always connect the main input first and any optional inputs after.

See also [Group](#) and [Output](#).

# Link

Link Nodes enable you to make a linked copy of a node, and have changes updated in both nodes, whilst optionally being able to override any of the knobs. See [Using Link Nodes](#).

In the node graph, go to **Edit > Link**. Link Nodes do not exist on their own and act as a connection between copied nodes only.

A yellow **L** on any nodes indicates a link node. A yellow box to the left of the node indicates an override.

## Inputs and Controls

| Connection Type | Connection Name | Function                   |
|-----------------|-----------------|----------------------------|
| Input           | unnamed         | The node you wish to link. |

# LiveGroup

LiveGroup nodes can be used in conjunction with LiveInput nodes so that multiple artists can work on different parts of the same shot as separate scripts, without the need for rendering. See [LiveInput](#) for more information.

LiveGroups are a hybrid of the functionality offered by Precomps, Groups, and Gizmos combining all the functionality that they lack individually. Just like Precomps, LiveGroups can store independent **.nk** files, allowing you to save a subset of the node tree as a separate **.nk** script, render the output of this saved script, and read the rendered output back into the source comp as a single image input.

You can also use LiveGroups like Group nodes to nest multiple nodes inside a single node. The original nodes are replaced with the LiveGroup node. When you create a LiveGroup node, its internal structure is shown in a separate Node Graph tab.

See also [Precomp](#) and [Group](#).

**Tip:** A **Variables** tab shows on the LiveGroup node. This allows you to work with Variables on shared scripts.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                     |
|-----------------|-----------------|----------------------------------------------------------------------------------------------|
| Input           | LiveInput1      | The image sequence to which you want to apply the nodes or script inside the LiveGroup node. |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                     |

# LiveInput

The LiveInput node is a type of Input node. Adding a LiveInput to a container type node, such as a Group, Precomp, or LiveGroup adds a corresponding input connection to that container node, just like an Input node.

LiveInput differs from Input nodes in that they can reference Nuke scripts external to the current script, allowing you to work collaboratively with other artists in the context of a source script without the need for rendering or reading footage from the source script.

## Inputs and Controls

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                              |

| Reload       | reload_script    | N/A           | Click to re-read the referenced Nuke script and recalculate the contents of the LiveGroup. |
| Open         | open             | N/A           | Click to open the script defined in the <b>file</b> control in a new Nuke session.         |

# NoOp

NoOp passes the input image through unchanged. It does not alter the image in any way, but can be used as an interface for controlling other nodes. To do so, right-click on the NoOp control panel, select **Manage User Knobs**, and add the control you need (for example, a checkbox). Then, **Ctrl+Cmd**+drag this control on top of a control in another node (for example, the **disable** checkbox of a Blur node). This creates a linking Tcl expression that parents the Blur node's **disable** checkbox to the checkbox in the NoOp controls, allowing you to use the NoOp controls to disable the Blur node.

You could also use a NoOp node to change the **file** path of multiple Read nodes using a single control.

For more information on Tcl expressions, see Nuke's [online help](#) or select **Help > Documentation > Knob Math Expressions** in Nuke.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                   |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | <p>This image sequence is passed through unchanged.</p> <p>This input is optional - you don't need to connect NoOp to the node you want it to control.</p> |

# Output

Adds an output arrow to a [Group](#) node. This is necessary if the node tree that forms the Group has several branches and thus several possible output nodes. It can also be useful if you accidentally delete an Output node from a Group.

The output arrows are always unnamed.

See also [Group](#) and [Input](#).

# PostageStamp

You can add this node to your script to display a thumbnail render of the output at the current frame or a frame of your choice. This node does not alter the input image in anyway.

By default, the postage stamp is always updated to match the current frame. To change this behavior, press **Shift+S** to open the **Preferences** dialog, go to the **Node Graph** tab, and set **postage stamp mode** to **Static frame**. Then, set **static frame** in the PostageStamp node properties to the frame you want to display.

**Note:** If the frame number you use is outside the frame range for the node, it is clamped to the first or last frame in the range.

# Precomp

The Precomp node is like a [Group](#) node, but its content is stored in an independent **.nk** file. This allows you to save a subset of the node tree as a separate Nuke script, render the output of this saved script, and read the rendered output back into the main comp as a single image input. Precomp nodes can be useful in at least two ways:

- They can be used to reduce portions of the node tree to pre-rendered image inputs. This speeds up render time, as Nuke only has to process the single image input instead of all the nodes that were used to create it. Because the original nodes are saved in a separate **.nk** script, you also maintain access to them and can adjust them later if necessary.

- They enable a collaborative workflow. While one artist works on the main comp, others can work on the sections that have been exported using the Precomp node. These sections can be edited, versioned, and managed independent of the main comp.

You can also create this node by pressing **Ctrl/Cmd+Shift+P** on the Node Graph.

See also [Group](#).

## Inputs and Controls

| Control (UI)         | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                     |

# Root

The **Project Settings** in the Compositing environment are contained within the Root node, but the node itself is never visible in the Node Graph. When you start working on a script, you should first define the settings for it in the **Project Settings**.

You can display the **Project Settings** by navigating to **Edit > Project Settings** or by pressing **S** in the Node Graph.

## Controls

| Control (UI) | Knob (Scripting) | Default Value | Function |
|--------------|------------------|---------------|----------|
| Root Tab     |                  |               |          |

| Control (UI)         | Knob (Scripting)  | Default Value | Function                                                                                                                                                        |
|----------------------|-------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name                 | name              | none          | Allows you to set the script name and path. This field is completed automatically the first time you save the script.                                           |
| project directory    | project_directory | none          | Sets the default location where project files are saved. For example, if you only specify a file name in a Write node, the files are rendered to this location. |
| Script Directory     | Script_directory  | N/A           | Click to set the <b>project directory</b> using an expression so that if the <b>.nk</b> file is relocated, the project directory updates automatically.         |
| comment              | label             | none          | Adds a comment to the script, which is only visible in the plain text of the <b>.nk</b> file in the <b>label</b> field.                                         |
| lock all connections | lock_connections  | disabled      | When enabled, all node connections are locked, making it easier to move nodes around the Node Graph without disconnecting them accidentally.                    |
| frame range          | first_frame       | 1             | Sets the frame range for the script, which is used for nodes that don't include their own frame range controls.                                                 |
|                      | last_frame        | 100           |                                                                                                                                                                 |
| lock range           | lock_range        | disabled      | When enabled, the frame range is locked so that adding new image sequences does not alter the frame range.<br><br>When disabled, adding new                     |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                   |
|------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  |                  |               | image sequences alters the frame range to encompass the new range.                                                                                                                                                                                                                         |
| fps              | fps              | 24            | Sets the project frame rate. Adjusting this control affects the Viewer's frame rate as well.                                                                                                                                                                                               |
| full size format | format           | 2K_Super_35   | Sets the default format for the project.                                                                                                                                                                                                                                                   |
| proxy mode       | proxy            | disabled      | When enabled, images are rendered at either the proxy <b>scale</b> or <b>format</b> as specified by the proxy type control.                                                                                                                                                                |
|                  | proxy_type       | scale         | Sets the proxy type when proxy mode is enabled: <ul style="list-style-type: none"> <li>• <b>format</b> - the proxy resolution is determined by the <b>proxy format</b> control.</li> <li>• <b>scale</b> - the proxy resolution is determined by the <b>proxy scale</b> control.</li> </ul> |
| proxy scale      | proxy_scale      | 0.5           | Sets the proxy resolution when the proxy type control is set to <b>scale</b> .                                                                                                                                                                                                             |
| proxy format     | proxy_format     | 1K_Super_35   | Sets the proxy resolution when the proxy type control is set to <b>format</b> .                                                                                                                                                                                                            |
| read proxy files | proxySetting     | if larger     | Sets when Read nodes fallback to the proxy resolution when <b>proxy mode</b> is enabled: <ul style="list-style-type: none"> <li>• <b>never</b> - the proxy resolution files are never used.</li> <li>• <b>if larger</b> - the proxy resolution</li> </ul>                                  |

# StickyNote

Lets you add notes to the Node Graph. The notes can be any text or HTML mark-up. Usually, they are made as annotations to the elements in the node tree.

See also [Backdrop](#).

# VariableGroup

The VariableGroup nodes allow you to define groups of Variables or scopes.

Inside the VariableGroup node, the Variables tab contains a single GsvKnob, which allows the user to create, edit and remove Variables and Variable Sets.

See more at [Using the VariableGroup Node](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                    |
|-----------------|-----------------|-------------------------------------------------------------|
| Input           | unnamed         | The place in the node graph to create a group of Variables. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                           |
|--------------|------------------|---------------|------------------------------------------------------------------------------------|
| Variables    | GsvKnob          | N/A           | In the Variables tab, you can create, edit and remove Variables and Variable Sets. |

# All plugins

This menu contains all nodes available in Nuke, including any unsupported nodes (such as earlier versions of the currently supported nodes). Note that some of these nodes may be unstable or cause unexpected behavior.

If you have any gizmos installed, they also appear in this menu.

To refresh the contents of the menu, click **Update**.

# FurnaceCore Nodes

FurnaceCore nodes contain the most popular Furnace plug-ins incorporated in NukeX and Nuke Studio.

**Note:** The following FurnaceCore nodes have been replaced by other nodes and can no longer be found in the **FurnaceCore** menu:

F\_DeGrain and F\_Denoise were replaced by Denoise (**Filter** > **Denoise**) in Nuke 6.3.

F\_Kronos was replaced by Kronos (**Time** > **Kronos**) in Nuke 7.0.

F\_MotionBlur was replaced by MotionBlur (**Filter** > **MotionBlur**) in Nuke 7.0.

F\_VectorGenerator was replaced by VectorGenerator (**Time** > **VectorGenerator**) in Nuke 7.0.

## F\_Align

F\_Align takes two sequences that were shot of the same scene and lines them up spatially. It uses Global Motion Estimation (GME) to calculate a four-corner pin so that each frame in one shot (the source input) will be aligned with the corresponding frame in a second shot (the reference input). The result is the source image which has been repositioned to line up with the reference image.

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | Ref             | The reference image used to align the source image. |
|                 | Src             | The source image to align.                          |

| Control (UI)           | Knob (Scripting) | Default Value     | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------|------------------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| F_Align Tab            |                  |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Analyse                | analyse          | N/A               | Click to begin analysis of the input clips and calculate a corner pin. Interrupting the analysis will not delete the corner pin keys that have already been calculated.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Render During Analysis | renderOn         | enabled           | <p>When enabled, this toggle causes the effect to update the time line and render a freshly analyzed frame in the Viewer so you can see the progress of the effect.</p> <div>  <b>Note:</b> Disabling this control may speed up the general analysis. </div>                                                                                                                                                                                                                                                   |
| Clear Analysis         | clear            | N/A               | Click to delete all key frames from the corner pin controls, allowing you to force a re-analysis if you feel the need to.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Analysis Range         | range            | Source Clip Range | <p>This controls the range of frames any analysis runs over:</p> <ul style="list-style-type: none"> <li>• <b>Specified Range</b> - reads the <b>Analysis Start</b> and <b>Analysis Stop</b> fields for the range of frames to analyze.</li> <li>• <b>Source Clip Range</b> - automatically determines the range of frames to analyze from the length of the clip attached to the <b>Src</b> input.</li> <li>• <b>Current Frame</b> - the analysis occurs only on the current frame. This is useful for correcting any errors that may have occurred while analyzing the entire clip.</li> </ul> |
| Analysis Start         | start            | 0                 | The first frame analyzed if <b>AnalysisRange</b> is set to <b>SpecifiedRange</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Analysis Stop          | stop             | 100               | The last frame analyzed if <b>AnalysisRange</b> is set to <b>SpecifiedRange</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

# F\_DeFlicker2

F\_DeFlicker2 is used to remove flicker - particularly flicker that is localized and dependent on the geometry of the scene (that is, flicker that is not present across the whole of the image), such as that caused by an unsynchronized fluorescent light in a shot.

**Note:** F\_DeFlicker2 looks at input frames outside the current frame when performing calculations, and therefore can be a computationally expensive node. As such, using more than two instances of F\_DeFlicker2 in a node tree will dramatically increase render times. It is strongly advised therefore, that you render each instance out separately.

## Inputs and Controls

| Connection Type | Connection Name | Function                          |
|-----------------|-----------------|-----------------------------------|
| Input           | Src             | The sequence requiring deflicker. |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                              |
|------------------|------------------|---------------|---------------------------------------------------------------------------------------|
| F_DeFlicker2 Tab |                  |               |                                                                                       |
| DeFlicker Amount | amount           | 0.3           | Reduces flicker without removing it entirely; lower values leave more flicker behind. |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Block Size     | blockSize        | 9.6           | <p>Defines the width and height of the control block (in pixels) centered around a particular pixel analysed by the deflicker algorithm.</p> <div>  <b>Note:</b> The default value avoids the loss of detail and noisy motion fields associated with higher and lower <b>BlockSize</b>, and rarely needs adjusting. </div> |
| Use Motion     | useMotion        | enabled       | Enables a second deflicker pass using motion-compensated frames. This can improve results in areas where there is fast motion, where the initial deflicker pass may have introduced blurring.                                                                                                                                                                                                               |
| Vector Detail  | vectorDetail     | 0.2           | Set the density of the motion vectors used when <b>UseMotion</b> is turned on. The maximum value of 1 generates one vector per pixel, producing the most accurate vectors, but taking longer to render. The default value of 0.2 generates a vector at every fifth pixel.                                                                                                                                   |
| Analysis Range | range            | 2             | The number of frames searched each side of the current frame when calculating the flicker. Higher values may give better results, but can also bring in erroneous information and take longer to process.                                                                                                                                                                                                   |
| About          | about            | N/A           | Displays a dialog containing information about this node.                                                                                                                                                                                                                                                                                                                                                   |

# F\_ReGrain

F\_ReGrain is used to add grain to a sequence. It is designed to sample an area of grain from one image and then to generate unlimited amounts of this grain with exactly the same statistics as the original. This new grain can then be applied to another image.

See also [Grain](#) and [ScannedGrain](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                       |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | Grain           | The image from which grain is sampled. When a <b>Grain</b> input is supplied, F_ReGrain automatically switches to using grain sampled from this input. However, the supplied grain stocks are still available. |
|                 | Src             | The image to which the grain is added.                                                                                                                                                                         |

# F\_RigRemoval

F\_RigRemoval eliminates unwanted objects, or rigs, from image sequences without the need for accurate rotoscoping or keying to produce a clean plate. The rig removal algorithm works by estimating the background motion between successive frames, ignoring the foreground object, and then using the motion information to look forward and backward in the sequence in order to find the correct piece of background to fill in the missing region.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------------|
| Input           | RigMask         | An optional mask to designate the rig area to remove.                                                                   |
|                 | Src             | The source image containing the unwanted object or rig. The source may contain an alpha channel to define the rig area. |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

If you are getting red pixels, then increase this value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Frames Used in Range | framesUsed       | Half of Frames       | <p>If the <b>Frame Range</b> is set to a large number, the rendering time can be prohibitive. <b>Frames Used in Range</b> may speed up the repair by not using every frame to fill the foreground region, effectively skipping frames. However, this may reduce the quality of the result.</p> <ul style="list-style-type: none"> <li>• <b>All Frames</b> - use every frame in the specified frame range to construct the repair.</li> <li>• <b>Half of Frames</b> - use every other frame in the specified frame range to construct the repair.</li> <li>• <b>Quarter of Frames</b> - use every fourth frame in the specified frame range to construct the repair.</li> </ul> |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  |                  |               | <ul style="list-style-type: none"><li>• <b>10% of Frames</b> - use every tenth frame in the specified frame range to construct the repair.</li><li>• <b>Max 25 Frames</b> - use no more than 25 frames from the specified frame range to construct the repair. This option can be useful if <b>Frame Range</b> has been set to a very large number.</li></ul>                                          |
| Max Rig Movement | maxRigMove       | 30            | To avoid perspective changes, F_RigRemoval searches for the missing data inside an area immediately around the <b>RigRegion</b> . <b>Max Rig Movement</b> defines the width of this area (in pixels). Fast movement in the <b>Src</b> input may require a higher value than slow movement.                                                                                                             |
| Rig Region Box   |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                        |
| Rig Region BL    | regionBL         | N/A           | The rectangular area used to define the repair when <b>Rig Region</b> is set to <b>Box</b> . <ul style="list-style-type: none"><li>• <b>Rig Region BL</b> - controls the position of the bottom left corner of the rig region.</li><li>• <b>Rig Region TR</b> - controls the position of the top right corner of the rig region.</li></ul>                                                             |
| Rig Region TL    | regionTR         | N/A           |                                                                                                                                                                                                                                                                                                                                                                                                        |
| Advanced         |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                        |
| Filtering        | filtering        | Medium        | Sets the filtering quality. <ul style="list-style-type: none"><li>• <b>Low</b> - low quality but quick to render.</li><li>• <b>Medium</b> - uses a bilinear filter. This gives good results and is quicker to render than high filtering.</li><li>• <b>High</b> - uses a sinc filter to interpolate pixels giving a sharper repair. This gives the best results but takes longer to process.</li></ul> |
| Luminance        | lumCorrect       | disabled      | Enable this to correct for luminance changes from                                                                                                                                                                                                                                                                                                                                                      |

| Control (UI)               | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                     |
|----------------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Correct                    |                  |               | information taken from other frames. This is particularly important if the lighting changes throughout the sequence.                                                                                                                                                         |
| Perspective Correct        | perspCorrect     | disabled      | Enable this to correct for minor perspective changes.                                                                                                                                                                                                                        |
| Overlap Correct            | overlapCorrect   | 1             | The repair is built up using slices of information from other frames in the sequence which are then overlapped and blended to give a more natural looking repair. This value controls how much the regions overlap. Increasing this value too much degrades image sharpness. |
| Repair Fail Marker Opacity | failOpacity      | 0.5           | Sets the level of transparency of the red pixels used to show where the repair has failed.                                                                                                                                                                                   |
| Preserve Alpha             | preserveAlpha    | disabled      | Enable this to preserve the original alpha channel. By default, the alpha channel is set to white where the repair has failed and black everywhere else.                                                                                                                     |
| About                      | about            | N/A           | Displays a dialog containing information about this node.                                                                                                                                                                                                                    |

# F\_Steadiness

F\_Steadiness uses Global Motion Estimation (GME) to calculate a four-corner pin, so that camera motion within a single shot can be smoothed out over a range of frames or removed by locking to a specific frame.

## Inputs and Controls

| Connection Type | Connection Name | Function                      |
|-----------------|-----------------|-------------------------------|
| Input           | Src             | The source clip to stabilize. |

| Control (UI)           | Knob (Scripting) | Default Value     | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------|------------------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| F_Steadiness Tab       |                  |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Analyse                | analyse          | N/A               | Click to begin an analysis of the input clip and calculate a corner pin. Interrupting the analysis will not delete the corner pin keys that have already been calculated.                                                                                                                                                                                                                                                                                                                                                   |
| Render During Analysis | renderOn         | enabled           | <p>When enabled, this toggle causes the effect to update the time line and render a freshly analyzed frame in the Viewer so you can see the progress of the effect.</p> <div>  <b>Note:</b> Disabling this control may speed up the general analysis. </div>                                                                                                                                                                               |
| Clear Analysis         | clear            | N/A               | Click to delete all key frames from the corner pin controls, allowing you to force a re-analysis if you feel the need to.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Analysis Range         | range            | Source Clip Range | <p>This controls the range of frames any analysis runs over:</p> <ul style="list-style-type: none"> <li>• <b>Specified Range</b> - reads the <b>Analysis Start</b> and <b>Analysis Stop</b> fields for the range of frames to analyze.</li> <li>• <b>Source Clip Range</b> - automatically determines the range of frames to analyze from the length of the clip attached to the <b>Src</b> input.</li> </ul>                                                                                                               |
| Analysis Start         | start            | 0                 | The first frame analyzed if <b>AnalysisRange</b> is set to <b>SpecifiedRange</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Analysis Stop          | stop             | 100               | The last frame analyzed if <b>AnalysisRange</b> is set to <b>SpecifiedRange</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Mode                   | mode             | Smooth            | <p>This controls whether F_Steadiness is smoothing the shot while keeping the overall camera motion, or locking the shot to a single frame to completely remove camera motion. It can be set to:</p> <ul style="list-style-type: none"> <li>• <b>Incremental Lock</b> - calculates the pin that takes each frame to the lock frame. This calculates the pin by working from the lock frame out to each frame, calculating the GME between each frame incrementally and accumulating it to create the corner pin.</li> </ul> |

| Control (UI)       | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    |                  |               | <ul style="list-style-type: none"> <li>• <b>Absolute Lock</b> - this also calculates a pin that takes each frame to the lock frame. However, it does so by doing GME directly from the frame in question directly to the lock frame.</li> <li>• <b>Smooth</b> - in which case, the shot is smoothed for a range of frames described by the <b>Smoothing</b> control. Use <b>Smooth</b> to keep the overall camera motion, but to smooth out sharp bumps and kicks.</li> </ul> |
| Scale              | scale            | disabled      | Indicates whether the calculated corner pin can include a scaling factor.                                                                                                                                                                                                                                                                                                                                                                                                     |

# F\_WireRemoval

F\_WireRemoval is particularly good at removing wires over heavily motion blurred backgrounds or wires over smoke, dust, or clouds. It can be used to remove each wire in a sequence or to quickly create a clean plate which can then be tracked into place.

F\_WireRemoval also incorporates a tracker which automatically tracks a moving wire through a clip. This tracker has its own control panel, which will float inside the Viewer if you have checked **Show On Screen Controls** in the F\_WireRemoval controls.

See also [RotoPaint](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                 |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | CleanPlate      | An optional input to allow you to supply a clean plate. This is used by the <b>CleanPlate</b> repair mode which will warp the clean plate onto the current frame and use the warped image to reconstruct the background behind the wire. |
|                 | Source          | The clip containing the wire to be removed.                                                                                                                                                                                              |

| Control (UI)                                                                        | Knob (Scripting)      | Default Value | Function                                                                                                                                                               |
|-------------------------------------------------------------------------------------|-----------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| F_WireRemoval Tab                                                                   |                       |               |                                                                                                                                                                        |
|    | setUserKeyFrame       | N/A           | Create user key frame - creates a user key frame.                                                                                                                      |
|    | deleteUserKeyFrame    | N/A           | Delete user key frame - deletes a user key frame.                                                                                                                      |
|    | snapToWire            | N/A           | Snap to wire - finds the edges of the wire and snaps the edges of the region onto them.                                                                                |
|    | trackBwd              | N/A           | Track backwards - plays backwards through the sequence tracking from frame to frame.                                                                                   |
|   | stepBwd               | N/A           | Step backward - tracks backwards one frame.                                                                                                                            |
|  | stepFwd               | N/A           | Step forward - tracks forward one frame.                                                                                                                               |
|  | trackFwd              | N/A           | Track forwards - plays forwards through the sequence tracking from frame to frame.                                                                                     |
|  | smartTrack            | N/A           | Smart track - tracks from beginning to end of frame range in an intelligent order.                                                                                     |
|  | deleteTrackKeysBwd    | N/A           | Delete track key frames backwards - deletes track key frames backwards through the sequence until either a user key frame or the beginning of the sequence is reached. |
|  | deleteTrackKeyStepBwd | N/A           | Delete track key frame and step backward - deletes a track key frame and steps backwards one frame.                                                                    |

| Control (UI)                                                                       | Knob (Scripting)      | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                         |

|-------------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   |                  |               | <p>only.</p> <ul style="list-style-type: none"> <li>• <b>Temporal With Static Scene</b> - this method uses LME to align frames from before and after onto the current frame. This is useful for sequences where the wire is moving and where the motion in the rest of the scene is non-uniform.</li> <li>• <b>Temporal With Moving Scene</b> - also aligns frames from before and after onto the current frame, but uses GME. This is useful for sequences where the wire is moving and the motion in the rest of the scene is fairly uniform.</li> <li>• <b>Clean Plate</b> - choose this method if you have a clean plate you wish to use for the repair, or if F_WireRemoval does not do a good job of removing the wire from each frame.</li> </ul> |
| Filter Size       | filterSize       | 5             | If the wire you are trying to remove has details within it (for example, a steel wire in which the twisted threads are reflecting light), then the algorithm may leave these alone, thinking that they are grain. In this situation, you can decrease the filter size.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Temporal Offset   | tempOffset       | 1             | Sets the time offset of the additional frames to use for the <b>Temporal With Static Scene</b> or <b>Temporal With Moving Scene</b> methods. This determines which two frames before and after the current frame are used to fill in the background behind the wire.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Luminance Correct | lumCorrect       | disabled      | Enable this where there are global luminance shifts between one frame of the sequence and the next, or between a frame of the sequence and a clean plate you are using for the repair.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                      |
|----------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |               |  <b>Note:</b> The <b>Spatial</b> repair mode does not benefit from <b>Luminance Correction</b> .             |
| Lum Block Size | lumBlockSize     | 31.12         | Altering the <b>Lum Block Size</b> could produce a better result if <b>Luminance Correction</b> is not performing as expected.                                                                |
| Points         |                  |               |                                                                                                                                                                                               |
| Point 1        | point1           | N/A           | The position of the start point on the wire.                                                                                                                                                  |
| Point 2        | point2           | N/A           | <p>The position of the point on the wire between the start point and the mid point.</p> <p>This is only active if <b>Type</b> is set to <b>Five Points</b>.</p>                               |
| Point 3        | point3           | N/A           | The position of the mid point on the wire.                                                                                                                                                    |
| Point 4        | point4           | N/A           | <p>The position of the point on the wire between the mid point and the end point.</p> <p>This is only active if <b>Type</b> is set to <b>Five Points</b>.</p>                                 |
| Point 5        | point5           | N/A           | The position of the end point on the wire.                                                                                                                                                    |
| Start Width    | startWidth       | 15.56         | The width of the wire at Point 1 of the on-screen wire tool.                                                                                                                                  |
| End Width      | endWidth         | 15.56         | The width of the wire at Point 5 of the on-screen wire tool. This allows you to make your repair region wider at one end than the other, for example, where there is motion blur on the wire. |
| Overall Width  | overallWidth     | 15.56         | Alter the width of the repair region along its entire length, and for all key frames.                                                                                                         |
| About          | about            | N/A           | Displays a dialog containing information about this node.                                                                                                                                     |

# AIR Machine Learning Nodes

AIR nodes are Machine Learning tools designed to assist artists with some of the heavy-lifting in VFX work.

## CatFileCreator

CatFileCreator gives you the ability to create your own custom **.cat** files from within Nuke. It also allows you to attach user knobs to your **.cat** files so that you can have complete control over your machine learning models via the Inference node.

**Warning:** It is important to note that not all PyTorch models work without modification. In order to correctly construct a TorchScript model from a PyTorch model please follow the guidelines laid out in the PyTorch user guide at <https://pytorch.org/docs/stable/jit.html> and the information provided by Foundry in the Nuke **.cat** File Creation Guide here: <https://learn.foundry.com/nuke/developers/15.2/catfilecreationreferenceguide/index.html>

## Inputs and Controls

| Control (UI)       | Knob (Scripting)    | Default Value | Function                                                                                                     |
|--------------------|---------------------|---------------|--------------------------------------------------------------------------------------------------------------|
| CatFileCreator Tab |                     |               |                                                                                                              |
| TorchScriptFile    | torchScriptFileKnob | none          | Specifies the file path to the <b>.pt</b> TorchScript model that you want to encode in the <b>.cat</b> file. |
| Cat File           | catFileKnob         | none          | Specifies the file path to the <b>.cat</b> file generated from the <b>.pt</b> file.                          |
| Channels In        | channelsInKnob      | none          | A comma separated list that defines the names of the input channels that your model uses.                    |

| Control (UI)                                                                                                                                                                                                                                           | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Channels Out                                                                                                                                                                                                                                           | channelsOuKnob    | none          | A comma separated list that defines the names of the output channels that your model uses.                                                                                                                                                                                                                                                                                                                                                                                                                     |
|  <b>Note:</b> Please refer to appendix in the Nuke <a href="#">CatFile Creation Reference Guide</a> for the correct channel names and the order in which to use them. |                   |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Model ID                                                                                                                                                                                                                                               | modelIdKnob       | none          | <p>An optional user-defined ID to identify the model encoded in the <b>.cat</b> file.</p> <p>Leaving this field blank stores an empty string in the <b>.cat</b> file.</p>                                                                                                                                                                                                                                                                                                                                      |
| Output Scale                                                                                                                                                                                                                                           | Output Scale      | 1             | <p>Defines how much the width and height of the input images are scaled by the model. For example, setting the <b>Output Scale</b> to 1.5 would mean that you are expecting the model to scale up the input by 50% so that a 512x512 input image would create a 768x768 output.</p> <div>  <b>Tip:</b> Click the <b>2</b> button in the <b>Properties</b> panel to scale the width and height independently.         </div> |
| Create .cat file and Inference                                                                                                                                                                                                                         | createCatFileKnob | N/A           | Click to create a <b>.cat</b> file from the specified <b>.pt</b> file and an Inference node. The Inference node references the new <b>.cat</b> file automatically.                                                                                                                                                                                                                                                                                                                                             |

# CopyCat

CopyCat (NukeX and Nuke Studio only) copies sequence-specific effects, such as garbage matting, beauty repairs, or deblurring, from a small number of frames in a sequence and then trains a network to replicate this effect on the full sequence. CopyCat outputs a trained network in a **.cat** file ready for the Inference node to apply your effect.

See also [Inference](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | Input           | The image sequence before any effects have been applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                 | Ground Truth    | The image sequence after the required effects have been applied. This input describes what the network is attempting to learn.                                                                                                                                                                                                                                                                                                                                                                                         |
|                 | Preview         | <p>An optional sample image overlay. This input is used to view how the model will work when applied to a frame that is not part of the data set you're using to train the model. As the training progresses, the <b>Preview</b> image should move toward the ideal result defined by the <b>Ground Truth</b>.</p> <div>  <b>Note:</b> This input is only visible when the <b>Input</b> and <b>Ground Truth</b> are connected. </div> |

| Use Multi-Resolution Training | useMultiResolutionTraining | on            | <p>Enabling multi-resolution training can speed up your training by up to two times.</p> <p>It does so by splitting the training into <b>three stages - low, medium, and high</b> resolution. During the low and medium-resolution stages, the input and ground truth <b>images are downsized</b> to 1/4 and 1/2 resolution respectively, allowing for fast training. In the final <b>high-resolution stage, the model is trained on full-resolution</b> input and ground truth images as regular CopyCat does, allowing the model to learn from the fine details and achieve optimal results.</p> <p>It is recommended that you <b>disable</b> multi-resolution training when using a <b>large dataset</b> of input and ground truth images (more than 100).</p> |

# Deblur

The Deblur node attempts to remove motion blur from the input image using a pre-trained machine learning network.

Before deblur applied

After deblur applied

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image to which the motion deblur is applied.                                                                                                                                                                                                                                                                                                                               |
|                 | mask            | <p>An optional image to use as a mask. By default, the effect is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled <b>mask</b>. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                   |

|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | mask downstream.                                                                                                             |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel, so that output is limited to the non-white areas of the mask.                           |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask. |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full blur effect at 1.                                                     |

# Inference

The Inference node applies a **.cat** file supplied by the CopyCat node to create the effect modeled by the network across the input image.

See [CopyCat](#) for more information.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                    |
|-----------------|-----------------|-------------------------------------------------------------|
| Input           | Input           | The image to which the CopyCat <b>.cat</b> file is applied. |

| Control (UI)         | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Optimize for Speed and Memory | inferencePrecision | disabled      | <p>When enabled, use 16-bit half-float precision instead of Nuke's standard 32-bit float precision.</p> <p>Enabling this control produces results more quickly, uses less GPU memory, and can handle larger images, but can result in artifacts with some trained networks.</p> <div>  <b>Note:</b> This control is hidden when <b>Use GPU if available</b> is disabled.         </div> |

# Upscale

The Upscale node increases the input format by a factor of two using a pre-trained machine learning network. For example, an input image at 1920x1080 upscales to a 3840x2160 output image.

## Inputs and Controls

| Connection Type | Connection Name | Function                                     |
|-----------------|-----------------|----------------------------------------------|
| Input           | Source          | The image to which the upscaling is applied. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                   |
|--------------|------------------|---------------|------------------------------------------------------------|
| Upscale Tab  |                  |               |                                                            |
| Local GPU    | gpuName          | N/A           | Displays the GPU used for rendering when <b>Use GPU if</b> |

| Control (UI)         | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|-------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                      |                   |               | <p><b>available</b> is enabled. Local GPU displays <b>Not available</b> when:</p> <ul style="list-style-type: none"> <li>• <b>Use CPU</b> is selected as the <b>default blink device</b> in the <b>Preferences</b>.</li> <li>• no suitable GPU was found on your system.</li> <li>• it was not possible to create a context for processing on the selected GPU, such as when there is not enough free memory available on the GPU.</li> </ul> <p>You can select a different GPU, if available, by navigating to the <b>Preferences</b> and selecting an alternative from the <b>default blink device</b> dropdown.</p> <p>Selecting a different GPU requires you to restart Nuke before the change takes effect.</p> |
| Use GPU if available | useGPUIfAvailable | enabled       | <p>When enabled, rendering occurs on the <b>Local GPU</b> specified, if available, rather than the CPU.</p> <div>  <p><b>Note:</b> Enabling this option with no local GPU allows the script to run on the GPU whenever the script is opened on a machine that does have a GPU available. You should also select this if you wish to render from the command line with the <b>--gpu</b> option.</p> </div> <p>See Nuke's <a href="#">Release Notes</a> pages for more information on the GPUs supported by your operating system.</p>                                                                                              |
