# Reference Guide

A reference guide for all the parameters within each node in Nuke. It does not give you any instructions on using Nuke. For details on installing and using Nuke, refer to Nuke's [online help](#).

**Note:** For the most up-to-date information, please see the Nuke product page and the latest Nuke Online Help on our website at [www.foundry.com](http://www.foundry.com).

## Getting Help

Nuke features several forms of help, in a variety of locations.

### Viewing Tooltips

Most controls offer concise instructions in the form of tooltips. To display the tooltips, move your mouse pointer over an interface control or a node parameter.

To view a tooltip for a node, move your mouse pointer over the **?** icon in the node's Properties panel.

## Viewing the Context-Sensitive Online Help

The context-sensitive online help includes a comprehensive description of each node and its parameters. To display these descriptions in your default web browser, click the **?** icon in the node's properties panel.

### Selecting the Help Source

In Nuke, the context-sensitive help content may differ depending on what you've selected as the help source in the **Preferences**.

To select the help source:

1. Press **Shift+S** on the Node Graph to open the **Preferences** dialog.
2. Go to the **Behaviors > Documentation** tab.
3. Set **documentation source** to:
  - **local** - Use Nuke's built-in help system. This is included in the Nuke installation and does not require an Internet connection.

**Note:** When you click **?** in a node's **Properties** panel, Nuke searches the following locations for HTML files with the same name as the requested node (for example, blur.html):

1. Directories contained in the NUKE\_PATH environment variable.
2. The **/\$HOME/.nuke** and **/\$HOME/.nuke/Documentation** directories.
3. Your local **plugins** directory.
  - On Windows, this is C:\Program Files\Common Files\Nuke\15.2\plugins\
  - On Mac, this is /Library/Application Support/Nuke/15.2/plugins/
  - On Linux, this is /usr/local/Nuke/15.2/plugins/
4. The Nuke installation directory.

- **foundry** - Use the help system available on our website. This contains the most up-to-date information, but requires an Internet connection.

**Note:** On Windows, you may have to add a firewall program or port exception to view the most up-to-date help from our website. If the connection is blocked, Nuke falls back to the **local** copy.

- **custom** - Use your own custom help system.
4. If you set **documentation source** to **local**, you can either:
- enable **auto port** to automatically assign a free documentation server port, or
  - use **local port** to specify a local documentation server port manually and **port range** to define a range of ports to attempt. Typically, the **local port** value should be 1024 or higher. Setting the value to 0 causes a port to be automatically assigned.

**Note:** To be able to use the online help from multiple sessions of Nuke running at the same time, you must enable **auto port**.

5. If you set **documentation source** to **foundry**:
- the **foundry host** field displays the documentation server host address.
  - use **foundry port** to specify the documentation server port.
6. If you set **documentation source** to **custom**:
- set **custom host** to your documentation server host address. This must be an Internet Protocol version 4 (IPv4) address.
  - use **local port** to specify a local documentation server port. Typically, the **local port** value should be 1024 or higher. Setting the value to 0 causes a port to be automatically assigned.
  - use **custom port** to specify a custom documentation server port.

## Using the Help Menu

You can click the main **Help** menu to access the following:

- **Key Assignments** - a list of hot keys.
- **Documentation** - the Nuke Online Help, the Nuke Developer Kit (NDK), and documentation for using Python, TCL, and expressions in Nuke.
- **Release Notes** - important updates to features and bug fixes.
- **Training and Tutorials** - Nuke tutorial videos, and a list of other training resources.
- **Nukepedia** - an online resource containing useful information about all things Nuke.
- **Mailing Lists** - information on Nuke-related e-mail lists.
- **Plug-in Installer** - open the Nuke plug-ins page on our website, which gives you easy access to a large selection of plug-ins for Nuke.

# Contacting Customer Support

Should questions arise that the documentation fails to address, you can visit the Support Portal at [support.foundry.com](https://support.foundry.com).

# Image Nodes

Image nodes deal with loading, viewing, and rendering image sequences as well as creating built-in Nuke elements, such as checkerboards and color wheels.

## CheckerBoard

Generates a checkerboard image that you can use as a placeholder for a texture or background.

**Note:** If you enable **proxy mode** the board may not match the full resolution version, because the boxes are rounded to the nearest pixel.

### Inputs and Controls

| Control (UI)     | Knob (Scripting) | Default Value                        | Function                                                                                                                            |
|------------------|------------------|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| CheckerBoard Tab |                  |                                      |                                                                                                                                     |
| format           | format           | Dependent on <b>Project Settings</b> | Sets the checkerboard's format. You can select a preset format or create a custom size using the <b>new</b> or <b>edit</b> options. |
| size             | boxsize          | 64                                   | Sets the size of the checkerboard boxes in pixels.                                                                                  |

| Control (UI)          | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| color 0 rgba          | color0           | N/A           | Sets the color of the boxes within the checkerboard starting from the bottom left-hand corner: <ul style="list-style-type: none"> <li>• <b>color 0</b> - the box at 0,0 and then every alternate box and row.</li> <li>• <b>color 1</b> - the box at 1,0 and then every alternate box and row.</li> <li>• <b>color 2</b> - the box at 1,1 and then every alternate box and row.</li> <li>• <b>color 3</b> - the box at 0,1 and then every alternate box and row.</li> </ul> |
| color 1 rgba          | color1           | N/A           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| color 2 rgba          | color2           | N/A           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| color 3 rgba          | color3           | N/A           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| line color            | linecolor        | 1             | Sets the color of the delineating line between boxes on the checkerboard.                                                                                                                                                                                                                                                                                                                                                                                                   |
| line width            | linewidth        | 0             | Sets the width, in pixels, of the delineating line between boxes on the checkerboard.                                                                                                                                                                                                                                                                                                                                                                                       |
| centerline color rgba | centerlinecolor  | N/A           | Sets the color of the center lines on the checkerboard.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| centerline width      | centerlinewidth  | 3             | Sets the width, in pixels, of the center lines on the checkerboard.                                                                                                                                                                                                                                                                                                                                                                                                         |

# ColorBars

Generates a Society of Motion Picture and Television Engineers (SMPTE) color bars test pattern, useful for color management.

## Inputs and Controls

| Control (UI)  | Knob (Scripting) | Default Value                        | Function                                                                                                                        |
|---------------|------------------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| ColorBars Tab |                  |                                      |                                                                                                                                 |
| format        | format           | Dependent on <b>Project Settings</b> | Sets the colorbar's format. You can select a preset format or create a custom size using the <b>new</b> or <b>edit</b> options. |
| bar intensity | barintensity     | 0.5                                  | Sets the color intensity of the bars.                                                                                           |
| PAL           | PAL              | disabled                             | When enabled, NTSC specific colors are removed and only PAL colors are displayed.                                               |

## ColorWheel

Generates a color wheel image.

## Inputs and Controls

| Control (UI)   | Knob (Scripting) | Default Value                        | Function                                                                                                                                                                                        |

|              | last             | 1                                    |                                                                                                                                                                                              |

## CurveTool

You can use this node to analyze and track the following aspects of the input sequence:

- the size and position of black areas in the sequence
- average pixel values in the sequence
- exposure changes in the sequence, and
- brightest and dimmest pixels in the sequence.

Based on the analysis, the node creates an animation curve. You can then use this curve data to drive effects elsewhere. For instance, you can add matching flicker to a CG render.

## Inputs and Controls

| Connection Type | Connection Name | Function                       |
|-----------------|-----------------|--------------------------------|
| Input           | unnamed         | The image sequence to analyze. |

| Control (UI)  | Knob (Scripting) | Default Value   | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Python Tab (These controls are for Python callbacks and can be used to have Python functions automatically called when various events happen in Nuke.) |                   |               |                                                                                                                                                      |
| before render                                                                                                                                          | beforeRender      | none          | These functions run prior to starting rendering in execute(). If they throw an exception, the render aborts.                                         |
| before each frame                                                                                                                                      | beforeFrameRender | none          | These functions run prior to starting rendering of each individual frame. If they throw an exception, the render aborts.                             |
| after each frame                                                                                                                                       | afterFrameRender  | none          | These functions run after each frame is finished rendering. They are not called if the render aborts. If they throw an exception, the render aborts. |
| after render                                                                                                                                           | afterRender       | none          | These functions run after rendering of all frames is finished. If they throw an error, the render aborts.                                            |
| render progress                                                                                                                                        | renderProgress    | none          | These functions run during rendering to determine progress or failure.                                                                               |

# Profile

The Profile node allows you to measure the performance of a script by inserting the node at any point in the node tree and then using the **Profile** pane to determine the output. If you have more than one Profile node in a script, use the **profile node** dropdown in the **Profile** pane to choose which point in the script to calculate.

See Nuke's [online help](#) for more information.

If they throw an exception, the render aborts.                                                                                                      |
| before each frame                                                                                                                                      | beforeFrameRender  | none                          | These functions run prior to starting rendering of each individual frame. If they throw an exception, the render aborts.                                                                                          |
| after each frame                                                                                                                                       | afterFrameRender   | none                          | These functions run after each frame is finished rendering. They are not called if the render aborts. If they throw an exception, the render aborts.                                                              |
| after render                                                                                                                                           | afterRender        | none                          | These functions run after rendering of all frames is finished. If they throw an error, the render aborts.                                                                                                         |
| render progress                                                                                                                                        | renderProgress     | none                          | These functions run during rendering to determine progress or failure.                                                                                                                                            |

# Read

This node loads images from disk, using the native resolution and the frame range for the sequence. It converts all imported sequences to Nuke's native 32-bit linear RGB colorspace.

The Read node supports multiple file formats, such as Cineon, TIFF, Alembic, PSD, OpenEXR, HDRI, DPX, R3D, ARRIRAW, DNG, and RAW camera data. It uses the file name extension to determine the format.

You can also create a Read node by pressing **R** on the Node Graph.

See also [DeepRead](#), [ReadGeo](#), [AudioRead](#), and [UDIM Import](#).

## Inputs and Controls

| Control (UI)        | Knob (Scripting)   | Default Value           | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Frame        | frame_mode       | expression        | <p>Sets the frame mode:</p> <ul style="list-style-type: none"> <li>• <b>expression</b> - Lets you enter an expression in the field on the right. The expression changes the relation between the current frame and the frame read in. For example, if your clip begins from image.0500.rgb and you want to place this first frame at frame 1 rather than frame 500, you can use the expression <b>frame+499</b>. This way, 499 frames are added to the current frame to get the number of the frame that's read in. At frame 1, image.0500.rgb is read in; at frame 2, image.0501.rgb is read in; and so on. Another example of an expression is <b>frame*2</b>. This expression multiplies the current frame by two to get the number of the frame that's read in. This way, only every other frame in the clip is used. At frame 1, image.0002.rgb is read in; at frame 2, image.0004.rgb is read in; at frame 3, image.0006.rgb is read in; and so on.</li> <li>• <b>startat</b> - Lets you enter a start frame number in the</li> </ul> |

| Control (UI)   | Knob (Scripting) | Default Value     | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|------------------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |                   | <p>field on the right. This specifies the frame where the first frame in the sequence is read in. In other words, all frames are offset so that the clip starts at the specified frame. For example, if your sequence begins from image.0500.rgb and you enter <b>1</b> in the field, image0500.rgb is read in at frame 1. Similarly, if you enter <b>100</b> in the field, image0500.rgb is read in at frame 100.</p> <ul style="list-style-type: none"> <li>• <b>offset</b> - Lets you enter a constant offset in the field on the right. This constant value is added to the current frame to get the number of the frame that's read in. For example, if your clip begins from image.0500.rgb and you want to place this first frame at frame 1 rather than frame 500, you can use <b>499</b> as the constant offset. This way, 499 is added to the current frame to get the frame that's read in. At frame 1, image.0500.rgb is read in; at frame 2, image.0501 is read in, and so on. You can also use negative values as the constant offset. For example, if you use the value -10, Nuke will subtract ten from the current frame to get the frame that's read in. At frame 20, image.0010.rgb is read in; at frame 21, image.0011.rgb is read in; and so on.</li> </ul> |
|                | frame            | none              | Depending on the <b>frame</b> mode, you can enter a start frame, an offset, or an expression here.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Local GPU            | N/A              | N/A           | <p>Displays the GPU used for rendering when <b>Use GPU if available</b> is enabled. Local GPU displays <b>Not available</b> when:</p> <ul style="list-style-type: none"> <li>• <b>Use CPU</b> is selected as the <b>default blink device</b> in the <b>Preferences</b>.</li> <li>• no suitable GPU was found on your system.</li> <li>• it was not possible to create a context for processing on the selected GPU, such as when there is not enough free memory available on the GPU.</li> </ul> <p>You can select a different GPU, if available, by navigating to the <b>Preferences</b> and selecting an alternative from the <b>default blink device</b> dropdown.</p> <div>  <b>Note:</b> Selecting a different GPU requires you to restart Nuke before the change takes effect. </div> |
| Use GPU if available | use_cuda         | disabled      | <p>When enabled, rendering occurs on the <b>Local GPU</b> specified, if available, rather than the CPU.</p> <div>  <b>Note:</b> Enabling this option with no local GPU allows the script to run on the GPU whenever the script is opened on a machine that does have a GPU available. You should also select this if you wish to render from the command line with the <b>--gpu</b> option. </div> <p>See Nuke's <a href="#">Release Notes</a> pages for more information on the GPUs supported by your</p>                                                                                                                                                                                                                                                                                  |

| Control (UI)                | Knob (Scripting)  | Default Value   | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------|-------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                             |                   |                 | operating system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Decode Resolution           | decode_resolution | Full Res        | Sets the output resolution decoded from the source file. Higher quality takes longer to decode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Decode Using                | decode_using      | Camera Metadata | Sets how the file is decoded, either using the file's encoded <b>Camera Metadata</b> or <b>Clip Custom</b> , which enables the <b>Blackmagic Design Custom</b> controls allowing you to make changes to the output in the Viewer.                                                                                                                                                                                                                                                                                                                                                                              |
| Load settings from metadata | load_settings     | N/A             | <p>Click to overwrite any changes to controls in the <b>Properties</b> panel with the camera metadata stored in the file.</p> <p>Any changes made to the <b>Properties</b> are discarded. If you want to compare your edits to the camera metadata, set <b>Decode Using</b> to <b>Camera Metadata</b> instead. That way you can toggle between your look and the original camera metadata.</p>                                                                                                                                                                                                                 |
| Update sidecar              | update_sidecar    | N/A             | <p>Click to overwrite an existing <b>.sidecar</b> file with the settings currently in the <b>Properties</b> panel.</p> <p>A <b>.sidecar</b> file contains artistic changes to the look of a <b>.braw</b> file, separate from the camera metadata stored in the <b>.braw</b> file. Sidecar files must reside in the same directory as the associated <b>.braw</b> file.</p> <p>If no <b>.sidecar</b> file exists in the same directory as the <b>.braw</b> file, Nuke creates one with the settings currently in the <b>Properties</b> panel. Clicking <b>Update sidecar</b> again overwrites the new file.</p> |
| Color Science               | viewing_bmdgen    | 5               | Sets the Blackmagic color science generation applied to the clip. Only the latest color science, <b>Gen5</b> , is currently supported. Later generations are scheduled for future releases.                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Control (UI)             | Knob (Scripting)             | Default Value                | Function                                                                                                                                                                   |
|--------------------------|------------------------------|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Color Space              | viewing_gamut                | Blackmagic Design            | Select the color gamut of the decoded image in the Viewer.                                                                                                                 |
| Gamma                    | viewing_gamma                | Blackmagic Design Film       | Select a gamma preset to use on the decoded image. Selecting <b>Blackmagic Design Custom</b> enables the controls under the <b>Blackmagic Design Custom</b> section below. |
| Blackmagic Design Custom |                              |                              |                                                                                                                                                                            |
| Saturation               | tone_curve_saturation        | dependent on camera metadata | Increases or decreases the overall saturation and contrast of the image.                                                                                                   |
| Contrast                 | tone_curve_contrast          |                              |                                                                                                                                                                            |
| Midpoint                 | tone_curve_midpoint          |                              | Increases or decreases the midtones, highlights, and shadows of the image.                                                                                                 |
| Highlight Rolloff        | tone_curve_highlights        |                              |                                                                                                                                                                            |
| Shadow Rolloff           | tone_curve_shadows           |                              |                                                                                                                                                                            |
| Black Level              | tone_curve_black_level       |                              | Sets the black and white levels in the image, the level of brightness at the darkest and lightest areas in the image, which affects the dynamic range of the image.        |
| White Level              | tone_curve_white_level       |                              |                                                                                                                                                                            |
| Use Video Black Level    | tone_curve_video_black_level |                              | When enabled, darken blacks to replicate video black levels.                                                                                                               |
| ISO                      | iso                          | 500                          | Sets the overall sensitivity of pixels from the raw image and can be used to control exposure.                                                                             |

| Control (UI)       | Knob (Scripting)         | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Detail                                                                                                                                                                                                                                       | r3dDetail        | 2             | Sets the amount of detail extracted from                                                                                                                                                                                                                                                      |

| Control (UI) | Knob (Scripting) | Default Value | Function                                               |
|--------------|------------------|---------------|--------------------------------------------------------|
|              |                  |               | the image, separate from the <b>Sharpness</b> control. |

**Note:** **Denoise** and **Detail** are only applicable when **Decode Resolution** is set to **full high**.

#### Lift/Gamma/Gain

|       |          |         |                                                           |
|-------|----------|---------|-----------------------------------------------------------|
| Lift  | r3dLift  | 0,0,0,0 | Adjusts the overall black level (dark tones and shadows). |
| Gamma | r3dGamma | 1,1,1,0 | Adjusts the overall mid tones.                            |
| Gain  | r3dGain  | 1,1,1,0 | Adjusts the overall highlights.                           |

**Note:** **Lift**, **Gamma**, and **Gain** are only available with **Color Version** v2 or higher. Setting **Gamma Curve** to **Half Float Linear** disables **Lift**, **Gamma**, and **Gain**.

# UDIM Import

UDIM Import lets you import a set of texture patches that follow the UDIM numbering scheme and quickly apply them to the surface of a 3D object. Clicking on UDIM Import opens the standard **Read File(s)** file browser. Browsing to, and selecting, a sequence containing valid UDIM patches opens the **UDIM Import** dialog. The **UDIM Import** dialog lists all the UDIM patches in a sequence and provides some options for managing them. If you select a file that doesn't contain a valid UDIM number, a dialog displays explaining the problem.

UDIM Import creates a Read node for every patch in the sequence and appends a UVTile node (which allows you to modify a patch's coordinates in UV space) to each one. For more information on the UVTile node see Nuke's [online help](#).

The **UDIM Import** dialog lets you disable individual patches in a sequence, add additional files and set how the Read nodes (for each individual patch) are displayed in the Node Graph. Enabling **postage stamp** displays a thumbnail view of the patch in the Read node. Checking **group nodes** adds the nodes to a single group node for clarity.

# UnrealReader

The UnrealReader node connects NukeX or Nuke Indie to an Unreal Editor session. It makes it quick and easy for compositors to work with pixels coming out of Unreal Editor by breaking objects into rendering layers, pulling AOVs, building environment maps, and making tweaks to shot framing.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | Camera          | <p>An optional input to add a render camera so that the Unreal scene is rendered using the input camera's <b>translation</b> and <b>rotation</b> and not the camera inside the Unreal sequence.</p> <div>  <b>Note:</b> You can only override <b>translation</b> and <b>rotation</b> from Unreal, the other camera values are unaffected.         </div> <p>This is a non-destructive process, the render camera does not overwrite the camera in Unreal Editor.</p> |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                     |
|------------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UnrealReader Tab |                  |               |                                                                                                                                                                                              |
| Server           |                  |               |                                                                                                                                                                                              |
| Host Name        | clientHostName   | 127.0.0.1     | <p>If Unreal Editor is running on a remote machine, enter the IP address of the machine here.</p> <p>If Nuke and Unreal are running on the same machine, the default address is correct.</p> |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port              | clientPort       | 9000          | <p>If Unreal Editor is running on a remote machine, enter the port the machine is listening on here.</p> <p>If Nuke and Unreal are running on the same machine, the default port is correct.</p>                                                                                                                                                                                                                                         |
| Connect to Server | connectToServer  | N/A           | <p>Click to connect UnrealReader to Unreal Editor using the <b>Host Name</b> and <b>Port</b> values shown.</p> <p>You only need to click this button once to initialize the connection and the button is replaced by <b>Fetch Latest</b> when the connection is established.</p>                                                                                                                                                         |
| Fetch Latest      | fetchLatestBtn   | N/A           | <p>When the connection to Unreal Editor is established, click <b>Fetch Latest</b> to retrieve the latest updates from the Nuke Server and populate the following fields:</p> <ul style="list-style-type: none"> <li>• Maps</li> <li>• Sequences</li> <li>• Linked Camera Output</li> <li>• Available Object ID Passes</li> <li>• OCIO settings and Custom Class Render Passes from the Unreal Engine <b>Nuke Server</b> panel</li> </ul> |
| Server Version    | serverVersion    | none          | Displays the version of Nuke Server you're running under.                                                                                                                                                                                                                                                                                                                                                                                |
| Project           |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Project Path      | projectPath      | none          | Displays the file path to the Unreal Editor project you're working with currently.                                                                                                                                                                                                                                                                                                                                                       |
| Map Filter        | mapFilter        | none          | Refines the available options in the Map dropdown. Searches can contain multiple words separated by the wild card character                                                                                                                                                                                                                                                                                                              |

| Control (UI)    | Knob (Scripting)      | Default Value | Function                                                                                                                                                                                                                                                                   |
|-----------------|-----------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                       |               | <p>* (asterisk). For example:<br/>shot0*take001*v002</p> <p>Matches the following string:<br/>cinematics/shot001/take0014/v002</p>                                                                                                                                         |
| Check Case      | mapCaseSensitive      | disabled      | When enabled, the <b>Map Filter</b> is case-sensitive.                                                                                                                                                                                                                     |
| Map             | map                   | none          | Selects the map to use for rendering in Unreal Editor.                                                                                                                                                                                                                     |

| OCIO Configuration Source | OCIO Transform             | None          | A read-only control displaying the OCIO config selected in Unreal Engine.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Source Color Space        | sourceColorSpace           | none          | When OCIO is enabled and a configuration is selected in Unreal Engine, choose the source and destination color spaces to convert from and to while working with                                                                                                                                                                                                                                                                                                                                    |

| Control (UI)                 | Knob (Scripting)          | Default Value     | Function                                                                                                                                     |
|------------------------------|---------------------------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Destination Color Space      | destinationColorSpace     | none              | Unreal content in Nuke.                                                                                                                      |
| Disable Tone Curve           | disableToneCurve          | disabled          | When enabled, the Filmic Tone Curve is applied to the output.<br><br>Disable this control if you want to write out linear <b>.exr</b> files. |
| Game Override                |                           |                   |                                                                                                                                              |
| Cinematic Quality            | cinematicQuality          | enabled           | When enabled, the engine is automatically set to the Cinematic Scalability quality for renders.                                              |
| Texture Streaming            | textureStreaming          | disable streaming | Choose whether textures are disabled, loaded over time, or fully loaded up front to avoid blurring after camera cuts.                        |
| Use LOD Zero                 | useLODZero                | enabled           | When enabled, use the highest LOD setting for meshes and particles.                                                                          |
| Disable HLODs                | disabledHLODs             | enabled           | When enabled, don't use hierarchical LOD and use the real meshes from Unreal Editor.                                                         |
| Use High Quality Shadows     | useHighQualityShadows     | enabled           | When enabled, shadow-related CVars (console variables) are replaced by high quality preset values.                                           |
| Shadow Distance Scale        | shadowDistanceScale       | 10                | Sets the shadow distance in the scene. Higher values produce better quality shadows, but at the cost of increased processing time.           |
| Shadow Radius Threshold      | shadowRadiusThreshold     | 0.001             | Sets the threshold at which shadow casters with small screen space bounding sphere values are discarded.                                     |
| Override View Distance Scale | overrideViewDistanceScale | enabled           | When enabled, the MaxDrawDistance from Unreal is overridden.                                                                                 |

| Control (UI)                   | Knob (Scripting)         | Default Value | Function                                                                                                                                                                                                                                                                                                 |
|--------------------------------|--------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                |                          |               | MaxDrawDistance may have been reduced to improve in-game performance.                                                                                                                                                                                                                                    |
| View Distance Scale            | viewDistanceScale        | 50            | When <b>override view distance scale</b> is enabled, scale primitive's MaxDrawDistance by this value.                                                                                                                                                                                                    |
| High Resolution                |                          |               |                                                                                                                                                                                                                                                                                                          |
| Texture Sharpness Bias         | textureSharpnessBias     | 0             | Causes the engine to use a higher detailed texture if a texture's details were lowered due to screen size.<br><br>Negative values produce sharper images, up to the resolution of the texture, but may result in noisy images. You can reduce the noise by increasing the <b>Spatial Samples Count</b> . |
| Override Subsurface Scattering | overSubsurfaceScattering | disabled      | When enabled, more samples are used to improve SSS when no temporal history is available due to the tiling process.                                                                                                                                                                                      |
| Burley Sample Count            | burleySampleCount        | 64            | Sets the number of samples used by SSS when <b>override subsurface scattering</b> is enabled.                                                                                                                                                                                                            |
| Motion blur                    |                          |               |                                                                                                                                                                                                                                                                                                          |
| Disable Motion Blur            | disableMotionBlur        | disabled      | When disabled, motion blur is not calculated.                                                                                                                                                                                                                                                            |
| Camera Tab                     |                          |               |                                                                                                                                                                                                                                                                                                          |
| Translate                      | camTranslate             | 0,0,0         | Displays translation values from the Unreal Editor camera along the x, y, and z axes.                                                                                                                                                                                                                    |
| Rotate                         | camRotate                | 0,0,0         | Displays rotation values from the Unreal Editor camera around the x, y, and z axes.                                                                                                                                                                                                                      |
| Focal Length                   | focalLength              | 50            | Displays the focal length from the Unreal Editor camera.                                                                                                                                                                                                                                                 |

| Control (UI)                 | Knob (Scripting) | Default Value   | Function                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------|------------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Aperture x,y                 | aperture         | 24.58,<br>18.67 | Displayed aperture information from the Unreal Editor camera.                                                                                                                                                                                                                                                                                                                |
| Create Camera                | createCameraBtn  | N/A             | <p>Click to create a corresponding Camera node in Nuke with the same translate, rotate, and camera lens details.</p> <p>The new camera does not affect the camera in Unreal Editor, but it is linked to it through an expression by default.</p>                                                                                                                             |
| Link Output                  | linkOutput       | enabled         | <p>When enabled, clicking <b>Create Camera</b> adds a Camera node to the Node Graph with an expression link to the Unreal camera.</p> <p>When disabled, no link is created so the Nuke camera is totally independent from Unreal Editor.</p>                                                                                                                                 |
| [BETA] New 3D                | new3D            | disabled        | <p>Sets the 3D system with which the <b>Camera</b> is compatible:</p> <p>When enabled, clicking the <b>Camera</b> button adds a new 3D system camera to the Node Graph. New 3D system nodes are red by default.</p> <p>When disabled, clicking the <b>Camera</b> button adds a classic 3D system camera to the Node Graph. Classic 3D system nodes are green by default.</p> |

# Viewer

The Viewer node displays the render output of any connected process nodes in the **Viewer** panel. It doesn't alter data in any way, but simply allows you to view the effect of any changes you make upstream.

You can place as many Viewer nodes in a script as you wish, which allows you to simultaneously view multiple outputs. You can also connect the output from up to ten process nodes into single Viewer node, and then cycle through the various displays. This allows you to easily compare an image before and after processing by a given effect.

You can also create this node by:

- selecting **Image > Viewer** from the Nuke Toolbar, or
- pressing **Ctrl/Cmd+I**.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                          |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The process node upstream to output to the Viewer. You can connect up to ten (0-9) nodes at once. |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                        |
|-------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Viewer Tab        |                  |               |                                                                                                                                                 |
| frame_range       | frame_range      | none          | Sets the first and last frame in the playback range. You can enter frame numbers here or Cmd+drag the red triangles in the timeline.            |
|                   | frame_range_lock | on            | Click to unlock or lock playback to the frame numbers specified in <b>frame_range</b> .                                                         |
| <<<br>>>increment | frame_increment  | 10            | Sets the number of frames to step through using the Viewer << and >> buttons.                                                                   |
| channels          | channels         | rgba          | <p>Sets the channels to display in the viewer.</p> <p>You can also select a channel from a different layer to display in the alpha channel.</p> |

| Control (UI)                     | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                    |
|----------------------------------|---------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| clip_warning                     | clip_warning        | no warnings   | When set to <b>exposure</b> , any pixels that are outside the 0-1 range are Zebra-striped in the Viewer.                                                                                                                                                    |
| gain                             | gain                | 1             | Sets the amount of gain to multiply the image by before display.                                                                                                                                                                                            |
| gamma                            | gamma               | 1             | <p>Sets the amount of gamma correction to apply to the image.</p> <p>Gamma correction is applied after the <b>gain</b>, <b>viewerprocess</b>, and any custom <b>inputprocess</b>.</p>                                                                       |
| apply LUT to color channels only | rgb_only            | off           | When enabled, the LUT is applied to color channels only.                                                                                                                                                                                                    |
| downrez                          | downrez             | 1             | <p>Sets the amount of down scaling applied before display. factor to speed up rendering.</p> <p>You can use <b>downrez</b> to speed up rendering, but bear in mind that it is multiplied into any global <b>proxy</b> scale that may also be in effect.</p> |
| ignore pixel aspect              | ignore_pixel_aspect | off           | When enabled, output to the Viewer ignores the file's pixel aspect ratio and always draws using square pixels.                                                                                                                                              |
| prevent auto zoom                | zoom_lock           | off           | When enabled, the Viewer is prevented from automatically adjusting the zoom level to fit new images into the Viewer when swapping between different sized images.                                                                                           |
| show overscan                    | show_overscan       | off           | When enabled, any overscan present                                                                                                                                                                                                                          |

| Control (UI)                 | Knob (Scripting)      | Default Value | Function                                                                                                                                                                                                                                                                                                                           |
|------------------------------|-----------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                              |                       |               | is displayed in the Viewer.                                                                                                                                                                                                                                                                                                        |
| enable full frame processing | full_frame_processing | off           | When enabled, force Nuke to render every scanline in the image. Compared to the default mode, this may take slightly longer initially and requires more space in the Viewer cache, but once Nuke has cached the frames you require, you can pan around and change the zoom level without breaking the cache or affecting playback. |
| overscan                     | overscan              | 100           | Sets the amount of overscan to show in the Viewer when <b>show overscan</b> ins enabled.                                                                                                                                                                                                                                           |
| safe zone                    | safe_zone             | no guides     | Sets the safe zone overlay to apply to the image: <ul style="list-style-type: none"> <li>• <b>no guides</b></li> <li>• <b>title safe</b></li> <li>• <b>action safe</b></li> <li>• <b>format center</b></li> </ul>                                                                                                                  |
| format center                | format_center         | off           | When enabled, the center of the format is marked with a cross in the Viewer.                                                                                                                                                                                                                                                       |
| mask region outside ratio    | masking_ratio         | square        | Sets the aspect ratio of the mask specified in the <b>mask mode</b> dropdown.                                                                                                                                                                                                                                                      |
| mask mode                    | masking_mode          | no mask       | Sets the mask overlay to apply to the image: <ul style="list-style-type: none"> <li>• <b>no mask</b></li> <li>• <b>lines</b></li> <li>• <b>half</b></li> </ul>                                                                                                                                                                     |

|                |                  |               | <p>individual object's geometry outlines.</p> <ul style="list-style-type: none"> <li>• <b>textured</b> - displays only the surface texture of objects.</li> <li>• <b>textured+lines</b> - displays the wireframe plus the surface texture.</li> <li>• <b>unchanged</b> - doesn't change object display modes.</li> </ul> <div>  <b>Note:</b> This setting can override individual object settings.         </div> |
| transparency   | use_alpha        | on            | When enabled, objects appear transparent where their alpha is < 1.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| headlamp       | gl_lighting      | off           | When enabled, objects are shaded with a spotlight attached to the viewpoint to make their shape visible.                                                                                                                                                                                                                                                                                                                                                                                             |
| alpha clipping | gl_alpha_clip    | 1             | Sets the alpha value used by the <b>transparency</b> control which determines if an object is opaque or not.                                                                                                                                                                                                                                                                                                                                                                                         |
| polygon offset | gl_poly_offset   | 1             | Sets the visibility of lines in hidden-line mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| show           | show_points      | off           | When enabled, all points are displayed in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                | show_point_num   | off           | When enabled, all points are numbered in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|                | show_point_info  | off           | When enabled, all points are labeled with xyz coordinates in the 3D Viewer.                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Control (UI) | Knob (Scripting)    | Default Value | Function                                                                                                                          |
|--------------|---------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------|
|              | show_point_normals  | off           | When enabled, all available point normals are displayed in the 3D Viewer.                                                         |
|              | show_point_uvs      | off           | When enabled, all available point uvs are displayed in the 3D Viewer.                                                             |
|              | show_vertex_num     | off           | When enabled, all vertices are labeled in the 3D Viewer.                                                                          |
|              | show_vertex_normals | off           | When enabled, all available vertex normals are displayed in the 3D Viewer.                                                        |
|              | show_vertex_uvs     | off           | When enabled, all available vertex uvs are displayed in the 3D Viewer.                                                            |
|              | show_prim_num       | off           | When enabled, all primitives are labeled in the 3D Viewer.                                                                        |
|              | show_prim_normals   | off           | When enabled, all primitive normals are labeled in the 3D Viewer.                                                                 |
|              | show_prim_bbox      | off           | When enabled, all primitive bounding boxes are labeled in the 3D Viewer.                                                          |
|              | grid_display        | on            | When enabled, a grid displays in the 3D Viewer.                                                                                   |
| default lens | default_lens        | 1             | Sets the default lens (focal length divided by film width) to use in 3D mode when no camera is selected.                          |
| near         | near                | 0.1           | Sets the limit of the OpenGL near clipping plane. Objects closer to the camera than this value are not rendered in the 3D Viewer. |
| far          | far                 | 1000          | Sets the limit of the OpenGL far clipping plane. Objects farther away                                                             |

| Control (UI)   | Knob (Scripting)      | Default Value | Function                                                                                                                                                                                                                                                                                                    |
|----------------|-----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                       |               | <p>from the camera that this value are not rendered the 3D Viewer.</p> <p>The <b>far</b> clipping plane can be moved farther away if objects in the scene are farther away. In this case, the <b>near</b> plane is also moved so that the ratio between <b>near</b> and <b>far</b> planes is preserved.</p> |
| skew order     | skew_order            | XY            | <p>Sets the order in which skew operations are applied.</p> <ul style="list-style-type: none"> <li>• <b>XY</b> - Skew on the X axis is applied before skew on the Y axis.</li> <li>• <b>YX</b> - Skew on the Y axis is applied before skew on the X axis.</li> </ul>                                        |
| Soft Selection |                       |               |                                                                                                                                                                                                                                                                                                             |
| Soft Select    | softSelect            | disabled      | <p>When enabled, soft selection is applied to any selection made in the Viewer.</p> <p>When disabled, selections are made in the same way as legacy versions of Nuke.</p>                                                                                                                                   |
| Falloff Radius | softSelectRadius      | 1             | Controls the radius of the selection falloff added to the initial selection. Increasing the value includes selections from farther away from the initial points or faces.                                                                                                                                   |
| Falloff Curve  | softSelectActiveCurve | S-shaped      | Sets the curve used to describe falloff farther away from the initial points or faces.                                                                                                                                                                                                                      |
| curves         | softSelectCurves      | none          | Adjusts the preset curve selected in the left-hand panel. You can also                                                                                                                                                                                                                                      |

| Control (UI)       | Knob (Scripting) | Default Value   | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# Write

This node renders the result of all upstream nodes and saves the result to disk. You would usually place one Write node at the bottom of the compositing tree to render the final output. However, Write nodes have both input and output connectors, so you can embed them anywhere in the compositing tree.

The Write node supports multiple file formats, such as Cineon, TIFF, QuickTime, Alembic, OpenEXR, HDRI, and DPX.

Note that this node executes all renders at the currently active scale: either full- or proxy-resolution. To toggle between these, press **Ctrl/Cmd+P**.

You can also create this node by pressing **W** on the Node Graph.

See also [WriteGeo](#).

| frame        | frame_mode       | expression    | <p>Sets the frame mode:</p> <ul style="list-style-type: none"> <li>• <b>expression</b> - Lets you enter an expression in the field on the right. The expression changes the relation between the currently processed frame and the numbering of the frame written out. The resulting file name for the current frame is displayed on the Write node in the Node Graph. For example, if your clip begins from frame 500 and you want to name that frame image.0001.exr rather than image.0500.exr, you can use the expression <b>frame-499</b>. This way, 499 frames are subtracted from the current frame to get the number for the frame written out. Frame 500 is written out as image.0001.exr, frame 501 is written out as image.0002.exr, and so on. Another example of an expression is <b>frame*2</b>. This expression multiplies the current frame by</li> </ul> |

|                  |                  |                               | <p>two to get the number of the frame that's written out. At frame 1, image.0002.exr is written out; at frame 2, image.0004.exr is written out; at frame 3, image.0006.exr is written out; and so on.</p> <ul style="list-style-type: none"> <li>• <b>startat</b> - Lets you enter a start frame number in the field on the right. This specifies the frame number given to the first frame in the sequence. The numbering of the rest of the frames is offset accordingly. For example, if your sequence begins from frame 500 and you enter <b>1</b> in the field, frame 500 is written out as image.0001.exr, frame 501 as image.0002.exr, and so on. Similarly, if you enter <b>100</b> in the field, frame 500 is written out as image.0100.exr.</li> <li>• <b>offset</b> - Lets you enter a constant offset in the field on the right. This constant value is added to the current frame to get the number for the frame that's written out. For example, if your clip begins from frame 500 and you want to render this first frame as image.0001.exr rather than image.0500.exr, you can use <b>-499</b> as the constant offset. This way, 499 is subtracted from the current frame to get the number for the frame that's written out. At frame 500, image.0001.exr is written out; at frame 501, image.0002.exr is written out, and so on.</li> </ul> |

| frame           |                  |               | rendering. They are not called if the render aborts. If they throw an exception, the render aborts.       |
| after render    | afterRender      | none          | These functions run after rendering of all frames is finished. If they throw an error, the render aborts. |
| render progress | renderProgress   | none          | These functions run during rendering to determine progress or failure.                                    |

## File Type Specific Controls

These controls are context sensitive depending on which format you intend to render.

### CIN

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                |
|--------------|------------------|---------------|---------------------------------------------------------------------------------------------------------|
| edge code    | edge_code        | none          | Sets the sequence's edge code, carried in the metadata, in the following format: 00 00 00 0000 0000 00. |

### DPX

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                       |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| data type    | datatype         | 10 bit        | Sets the bit depth of the rendered .dpx files: <ul style="list-style-type: none"> <li>• 8-bit</li> <li>• 10-bit</li> <li>• 12-bit</li> <li>• 16-bit</li> </ul> |
| fill         | fill             | disabled      | When enabled, 10- and 12-bit data is compressed by                                                                                                             |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                     |
|--------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | removing unused parts of the image.                                                                                                                                                                          |
| big endian   | bigEndian        | enabled       | When enabled, the rendered file is big-endian, rather than native-endian. Big-endian files take longer to render, but some applications only accept big-endian files.                                        |
| transfer     | transfer         | (auto detect) | Set the <b>Transfer header</b> in the rendered <b>.dpx</b> files.<br><br>By default, Nuke attempts to set the header according to the LUT used, but the <b>transfer</b> control allows you to override this. |

| interleave   | interleave       | channels, layers and views | <p>Sets the interleave strategy for channels, layers, and views with a rendered <b>.exr</b> file. A single- or multi-part <b>.exr</b> file is created as described by the following options, with layers and parts sorted alphabetically:</p> <ul style="list-style-type: none"> <li>• <b>channels, layers and views</b> - creates a single-part <b>.exr</b> file ensuring backward compatibility with applications that use OpenEXR 1.x.</li> <li>• <b>channels and layers</b> - creates a multi-part <b>.exr</b> file with one part per view. This can improve Read performance as Nuke only reads the part associated with the specified view.</li> <li>• <b>channels</b> - creates a multi-part <b>.exr</b> with one part per layer.</li> </ul> <p>Interleaving is done between elements within a section (part) of <b>.exr</b> files. Interleaving channels, layers, and views is done when the whole <b>.exr</b> is written out in one large part. This is quicker for writing but it involves more work when reading only part of the data.</p> <p>For performance, you should interleave only those elements which are expected to be read together. If you're only reading some layers in each Read node, then it's best not to interleave the layers.</p> <p>If you expect to read all the layers in each Read node, then you can optimize write performance by bundling everything together. Generally, there are a lot of layers in <b>.exr</b> file so this</p> |

| Control (UI)               | Knob (Scripting)           | Default Value | Function                                                                                                                                                                                                                                                                                        |

This sets the encoding depth used when decompressing the frames. A large bit depth gives higher accuracy at the cost of speed and memory usage.</li> </ul>                                                                                                                                               |
| Quality      | mov64_quality           | High          | <p>Selects a preset level that automatically adjusts the <b>Advanced</b> controls. Higher values produce larger files with better quality.</p> <p>Select <b>Custom</b> to adjust the <b>Advanced</b> controls manually.</p>                                                                                                                                                                          |
| YCbCr Matrix | mov64_ycbcr_matrix_type | Auto          | <p>Sets the way RGB is converted to Y'CbCr. <b>Rec 601</b> and <b>Rec 709</b> follow the ITU.BC specifications.</p> <p><b>Auto</b> uses a set a heuristics to determine the best color matrix to use, including <b>Format-based</b>, which sets the color matrix to <b>Rec 601</b> for formats with a width below 840 pixels and <b>Rec 709</b> for formats with a width of 840 pixels or above.</p> |
| Audio File   | mov64_audiofile         | N/A           | <p>Allows you to specify a separate audio file to include in the output.</p> <p>Either enter the file path manually or click the browse button to locate the audio file.</p>                                                                                                                                                                                                                         |
| Audio Offset | mov64_audio_offset      | 0             | <p>Sets the start time of any audio file specified in the <b>Audio File</b> control. The unit of measure is specified using the <b>Units</b> control.</p> <p>Negative values cause the audio to start before the video and vice versa.</p>                                                                                                                                                           |
| Units        | mov64_units             | Seconds       | <p>Sets the unit of measure for the <b>audio offset</b> control:</p> <ul style="list-style-type: none"> <li>• <b>Seconds</b></li> <li>• <b>Frames</b></li> </ul>                                                                                                                                                                                                                                     |
| Advanced     |                         |               |                                                                                                                                                                                                                                                                                                                                                                                                      |

| Control (UI)        | Knob (Scripting)        | Default Value     | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|-------------------------|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Data Range          | dataRange               | Video Range       | Sets the minimum and maximum color range values for encoding DNx files: <ul style="list-style-type: none"><li>• <b>Full Range</b> - encodes with the full data range (0-255 for 8-bit or 0-1023 for 10-bit).</li><li>• <b>Video Range</b> - encodes with a reduced, or video/legal, data range (16-240 for 8-bit or 64-960 for 10-bit).</li></ul>                                                                                                                            |
| Fast Start          | mov64_fast_start        | enabled           | When enabled, MOVs are playable while still down loading during streaming.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Write Timecode      | mov64_write_timecode    | enabled           | <p>When enabled, a time code track is added to the rendered <b>.mov</b> file.</p> <p>You can also use the quicktime/reel metadata, if present, to give the track its reel name. You can add this key using the ModifyMetaData node if it doesn't exist.</p> <div> <b>Note:</b> The <b>input/timecode</b> key must be present in the sequence metadata in order to write a time code.</div> |
| Bitrate             | mov64_bitrate           | 200000            | Sets the target bitrate that the codec attempts to reach, within the limits set by the <b>Bitrate Tolerance</b> and <b>Quantizer Min/Max</b> controls.                                                                                                                                                                                                                                                                                                                       |
| Bitrate Tolerance   | mov64_bitrate_tolerance | 4000000           | Sets the amount that the bitrate can vary from the <b>Bitrate</b> setting. Setting this tolerance too low can result in renders failing.                                                                                                                                                                                                                                                                                                                                     |
| Quantizer Min       | mov64_quailty_min       | 1                 | Sets the quality range within which the codec can vary the image to achieve the specified bitrate. Higher ranges can introduce image degradation.                                                                                                                                                                                                                                                                                                                            |
| Quantizer Max       | mov64_quailty_max       | 3                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Motion JPEG B Codec |                         |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Pixel Format        | mov64_pixel_format      | YCbCr 4:4:4 8-bit | Lists pixel formats supported by the current codec:                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Control (UI) | Knob (Scripting)        | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|-------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                         |               | <ul style="list-style-type: none"> <li>• <b>Pixel layout</b> - 420, 422, 444, and so on. This defines how the chroma channels in the buffer are arranged. 444 buffers have lower spatial chroma sampling than 422, so they are generally preferred when available.</li> <li>• <b>Pixel bit-depth</b> - 8-bit, 16-bit, and so on. This sets the encoding depth used when decompressing the frames. A large bit depth gives higher accuracy at the cost of speed and memory usage.</li> </ul> |
| Quality      | mov64_quality           | High          | <p>Selects a preset level that automatically adjusts the <b>Advanced</b> controls. Higher values produce larger files with better quality.</p> <p>Select <b>Custom</b> to adjust the <b>Advanced</b> controls manually.</p>                                                                                                                                                                                                                                                                 |
| YCbCr Matrix | mov64_ycbcr_matrix_type | Auto          | <p>Sets the way RGB is converted to Y'CbCr. <b>Rec 601</b> and <b>Rec 709</b> follow the ITU.BC specifications.</p> <p><b>Auto</b> uses a set of heuristics to determine the best color matrix to use, including <b>Format-based</b>, which sets the color matrix to <b>Rec 601</b> for formats with a width below 840 pixels and <b>Rec 709</b> for formats with a width of 840 pixels or above.</p>                                                                                       |
| Audio File   | mov64_audiofile         | N/A           | <p>Allows you to specify a separate audio file to include in the output.</p> <p>Either enter the file path manually or click the browse button to locate the audio file.</p>                                                                                                                                                                                                                                                                                                                |
| Audio Offset | mov64_audio_offset      | 0             | <p>Sets the start time of any audio file specified in the <b>Audio File</b> control. The unit of measure is specified using the <b>Units</b> control.</p> <p>Negative values cause the audio to start before the video and vice versa.</p>                                                                                                                                                                                                                                                  |
| Units        | mov64_units             | Seconds       | Sets the unit of measure for the <b>audio offset</b> control:                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Control (UI)      | Knob (Scripting)        | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Data Range        | dataRange               | Video Range   | <p>Sets the minimum and maximum color range values for encoding DNx files:</p> <ul style="list-style-type: none"> <li>• <b>Full Range</b> - encodes with the full data range (0-255 for 8-bit or 0-1023 for 10-bit).</li> <li>• <b>Video Range</b> - encodes with a reduced, or video/legal, data range (16-240 for 8-bit or 64-960 for 10-bit).</li> </ul>                                                                                                                     |
| Fast Start        | mov64_fast_start        | enabled       | When enabled, MOVs are playable while still down loading during streaming.                                                                                                                                                                                                                                                                                                                                                                                                      |
| Write Timecode    | mov64_write_timecode    | enabled       | <p>When enabled, a time code track is added to the rendered <b>.mov</b> file.</p> <p>You can also use the quicktime/reel metadata, if present, to give the track its reel name. You can add this key using the ModifyMetaData node if it doesn't exist.</p> <div>  <b>Note:</b> The <b>input/timecode</b> key must be present in the sequence metadata in order to write a time code. </div> |
| Bitrate           | mov64_bitrate           | 200000        | Sets the target bitrate that the codec attempts to reach, within the limits set by the <b>Bitrate Tolerance</b> and <b>Quantizer Min/Max</b> controls.                                                                                                                                                                                                                                                                                                                          |
| Bitrate Tolerance | mov64_bitrate_tolerance | 4000000       | Sets the amount that the bitrate can vary from the <b>Bitrate</b> setting. Setting this tolerance too low can result in renders failing.                                                                                                                                                                                                                                                                                                                                        |
| Quantizer Min     | mov64_quality_min       | 1             | Sets the quality range within which the codec can vary the image to achieve the specified bitrate. Higher ranges can introduce image degradation.                                                                                                                                                                                                                                                                                                                               |
| Quantizer         | mov64_                  | 3             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Control (UI)        | Knob (Scripting)        | Default Value     | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Max                 | quality_max             |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>MPEG-4 Codec</b> |                         |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Pixel Format        | mov64_pixel_format      | YCbCr 4:2:0 8-bit | <p>Lists pixel formats supported by the current codec:</p> <ul style="list-style-type: none"> <li>• <b>Pixel layout</b> - 420, 422, 444, and so on. This defines how the chroma channels in the buffer are arranged. 444 buffers have lower spatial chroma sampling than 422, so they are generally preferred when available.</li> <li>• <b>Pixel bit-depth</b> - 8-bit, 16-bit, and so on. This sets the encoding depth used when decompressing the frames. A large bit depth gives higher accuracy at the cost of speed and memory usage.</li> </ul> |
| Quality             | mov64_quality           | High              | <p>Selects a preset level that automatically adjusts the <b>Advanced</b> controls. Higher values produce larger files with better quality.</p> <p>Select <b>Custom</b> to adjust the <b>Advanced</b> controls manually.</p>                                                                                                                                                                                                                                                                                                                            |
| YCbCr Matrix        | mov64_ycbcr_matrix_type | Auto              | <p>Sets the way RGB is converted to Y'CbCr. <b>Rec 601</b> and <b>Rec 709</b> follow the ITU.BC specifications.</p> <p><b>Auto</b> uses a set a heuristics to determine the best color matrix to use, including <b>Format-based</b>, which sets the color matrix to <b>Rec 601</b> for formats with a width below 840 pixels and <b>Rec 709</b> for formats with a width of 840 pixels or above.</p>                                                                                                                                                   |
| Audio File          | mov64_audiofile         | N/A               | <p>Allows you to specify a separate audio file to include in the output.</p> <p>Either enter the file path manually or click the browse button to locate the audio file.</p>                                                                                                                                                                                                                                                                                                                                                                           |
| Audio Offset        | mov64_audio_offset      | 0                 | <p>Sets the start time of any audio file specified in the <b>Audio File</b> control. The unit of measure is specified using the <b>Units</b> control.</p>                                                                                                                                                                                                                                                                                                                                                                                              |

| Control (UI)   | Knob (Scripting)     | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|----------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                      |               | Negative values cause the audio to start before the video and vice versa.                                                                                                                                                                                                                                                                                                                                                                                                       |
| Units          | mov64_units          | Seconds       | Sets the unit of measure for the <b>audio offset</b> control: <ul style="list-style-type: none"> <li>• <b>Seconds</b></li> <li>• <b>Frames</b></li> </ul>                                                                                                                                                                                                                                                                                                                       |
| Advanced       |                      |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Data Range     | dataRange            | Video Range   | Sets the minimum and maximum color range values for encoding DNx files: <ul style="list-style-type: none"> <li>• <b>Full Range</b> - encodes with the full data range (0-255 for 8-bit or 0-1023 for 10-bit).</li> <li>• <b>Video Range</b> - encodes with a reduced, or video/legal, data range (16-240 for 8-bit or 64-960 for 10-bit).</li> </ul>                                                                                                                            |
| Fast Start     | mov64_fast_start     | enabled       | When enabled, MOVs are playable while still down loading during streaming.                                                                                                                                                                                                                                                                                                                                                                                                      |
| Write Timecode | mov64_write_timecode | enabled       | <p>When enabled, a time code track is added to the rendered <b>.mov</b> file.</p> <p>You can also use the quicktime/reel metadata, if present, to give the track its reel name. You can add this key using the ModifyMetaData node if it doesn't exist.</p> <div>  <b>Note:</b> The <b>input/timecode</b> key must be present in the sequence metadata in order to write a time code. </div> |
| GOP Size       | mov64_gop_size       | 12            | <p>Sets how many frames can be placed together to form a compression GOP (group of pictures).</p> <div>  <b>Note:</b> Use caution with this control as large alterations can stop other applications reading the rendered file. </div>                                                                                                                                                       |

| Control (UI)      | Knob (Scripting)        | Default Value     | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|-------------------------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| B Frames          | mov64_b_frames          | 0                 | <p>Sets the maximum number of B frames that can be consecutive in the rendered file.</p> <p>The default, 0, does not impose any maximum number of B frames in the output.</p>                                                                                                                                                                                                                                                                                                                                                                       |
| Limit Bitrate     | mov64_limit_bitrate     | disabled          | <p>When enabled, the maximum <b>Bitrate</b> is capped and the <b>Bitrate Tolerance</b> is set to 0.</p> <p>This control is designed to reduce output file size, but the render quality is generally lower.</p>                                                                                                                                                                                                                                                                                                                                      |
| Bitrate           | mov64_bitrate           | 200000            | Sets the target bitrate that the codec attempts to reach, within the limits set by the <b>Bitrate Tolerance</b> and <b>Quantizer Min/Max</b> controls.                                                                                                                                                                                                                                                                                                                                                                                              |
| Bitrate Tolerance | mov64_bitrate_tolerance | 4000000           | Sets the amount that the bitrate can vary from the <b>Bitrate</b> setting. Setting this tolerance too low can result in renders failing.                                                                                                                                                                                                                                                                                                                                                                                                            |
| Quantizer Min     | mov64_quality_min       | 1                 | Sets the quality range within which the codec can vary the image to achieve the specified bitrate. Higher ranges can introduce image degradation.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Quantizer Max     | mov64_quality_max       | 3                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| PHOTO JPEG Codec  |                         |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Pixel Format      | mov64_pixel_format      | YCbCr 4:4:4 8-bit | <p>Lists pixel formats supported by the current codec:</p> <ul style="list-style-type: none"><li>• <b>Pixel layout</b> - 420, 422, 444, and so on. This defines how the chroma channels in the buffer are arranged. 444 buffers have lower spatial chroma sampling than 422, so they are generally preferred when available.</li><li>• <b>Pixel bit-depth</b> - 8-bit, 16-bit, and so on. This sets the encoding depth used when decompressing the frames. A large bit depth gives higher accuracy at the cost of speed and memory usage.</li></ul> |
| Quality           | mov64_quality           | High              | Selects a preset level that automatically adjusts the <b>Advanced</b> controls. Higher values produce larger files                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Control (UI) | Knob (Scripting)        | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------|-------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                         |               | <p>with better quality.</p> <p>Select <b>Custom</b> to adjust the <b>Advanced</b> controls manually.</p>                                                                                                                                                                                                                                                                                             |
| YCbCr Matrix | mov64_ycbcr_matrix_type | Auto          | <p>Sets the way RGB is converted to Y'CbCr. <b>Rec 601</b> and <b>Rec 709</b> follow the ITU.BC specifications.</p> <p><b>Auto</b> uses a set a heuristics to determine the best color matrix to use, including <b>Format-based</b>, which sets the color matrix to <b>Rec 601</b> for formats with a width below 840 pixels and <b>Rec 709</b> for formats with a width of 840 pixels or above.</p> |
| Audio File   | mov64_audiofile         | N/A           | <p>Allows you to specify a separate audio file to include in the output.</p> <p>Either enter the file path manually or click the browse button to locate the audio file.</p>                                                                                                                                                                                                                         |
| Audio Offset | mov64_audio_offset      | 0             | <p>Sets the start time of any audio file specified in the <b>Audio File</b> control. The unit of measure is specified using the <b>Units</b> control.</p> <p>Negative values cause the audio to start before the video and vice versa.</p>                                                                                                                                                           |
| Units        | mov64_units             | Seconds       | <p>Sets the unit of measure for the <b>audio offset</b> control:</p> <ul style="list-style-type: none"> <li>• <b>Seconds</b></li> <li>• <b>Frames</b></li> </ul>                                                                                                                                                                                                                                     |
| Advanced     |                         |               |                                                                                                                                                                                                                                                                                                                                                                                                      |
| Data Range   | dataRange               | Video Range   | <p>Sets the minimum and maximum color range values for encoding DNx files:</p> <ul style="list-style-type: none"> <li>• <b>Full Range</b> - encodes with the full data range (0-255 for 8-bit or 0-1023 for 10-bit).</li> <li>• <b>Video Range</b> - encodes with a reduced, or video/legal, data range (16-240 for 8-bit or 64-960 for 10-bit).</li> </ul>                                          |

| Control (UI)      | Knob (Scripting)        | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|-------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fast Start        | mov64_fast_start        | enabled       | When enabled, MOVs are playable while still down loading during streaming.                                                                                                                                                                                                                                                                                                                                                                                                    |
| Write Timecode    | mov64_write_timecode    | enabled       | <p>When enabled, a time code track is added to the rendered <b>.mov</b> file.</p> <p>You can also use the quicktime/reel metadata, if present, to give the track its reel name. You can add this key using the ModifyMetaData node if it doesn't exist.</p> <div>  <b>Note:</b> The <b>input/timecode</b> key must be present in the sequence metadata in order to write a time code. </div> |
| Bitrate           | mov64_bitrate           | 200000        | Sets the target bitrate that the codec attempts to reach, within the limits set by the <b>Bitrate Tolerance</b> and <b>Quantizer Min/Max</b> controls.                                                                                                                                                                                                                                                                                                                        |
| Bitrate Tolerance | mov64_bitrate_tolerance | 4000000       | Sets the amount that the bitrate can vary from the <b>Bitrate</b> setting. Setting this tolerance too low can result in renders failing.                                                                                                                                                                                                                                                                                                                                      |
| Quantizer Min     | mov64_quality_min       | 1             | Sets the quality range within which the codec can vary the image to achieve the specified bitrate. Higher ranges can introduce image degradation.                                                                                                                                                                                                                                                                                                                             |
| Quantizer Max     | mov64_quality_max       | 3             | Quantizer Max                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>PNG Codec</b>  |                         |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Pixel Format      | mov64_pixel_format      | RGB 16-bit    | <p>Lists pixel formats supported by the current codec:</p> <ul style="list-style-type: none"> <li>• <b>Pixel bit-depth</b> - 8-bit, 16-bit, and so on. This sets the encoding depth used when decompressing the frames. A large bit depth gives higher accuracy at the cost of speed and memory usage.</li> </ul>                                                                                                                                                             |
| Audio File        | mov64_audiofile         | N/A           | Allows you to specify a separate audio file to include in the output.                                                                                                                                                                                                                                                                                                                                                                                                         |

| Control (UI) | Knob (Scripting)   | Default Value | Function                                                                                                                                                                                                                                   |

## PNG

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                          |
|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------|
| data type    | datatype         | 8 bit         | Sets the bit depth of the rendered <b>.png</b> files: <ul style="list-style-type: none"> <li>• 8-bit</li> <li>• 16-bit</li> </ul> |

## SGI

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                              |
|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| data type    | datatype         | 8 bit         | Sets the bit depth of the rendered <b>.sgi</b> files: <ul style="list-style-type: none"> <li>• 8-bit</li> <li>• 16-bit</li> </ul>                                     |
| big endian   | bigEndian        | enabled       | When enabled, the rendered file is big-endian, rather than native-endian. Big-endian files take longer to render, but some applications only accept big-endian files. |
| compression  | compression      | RLE           | Sets the compression type to apply to the rendered file.                                                                                                              |

## TARGA

| Control (UI) | Knob (Scripting) | Default Value | Function                                                 |
|--------------|------------------|---------------|----------------------------------------------------------|
| compression  | compression      | RLE           | Sets the compression type to apply to the rendered file. |

## TIFF

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                   |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| data type    | datatype         | 8 bit         | Sets the bit depth of the rendered <b>.tiff</b> files: <ul style="list-style-type: none"> <li>• 8-bit</li> <li>• 16-bit</li> <li>• 32-bit float</li> </ul> |
| compression  | compression      | Deflate       | Sets the compression type to apply to the rendered file.                                                                                                   |

## YUV

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                  |
|--------------|------------------|---------------|---------------------------------------------------------------------------|
| interlaced   | interlaced       | disabled      | When enabled, the file is rendered as interlaced rather than progressive. |

# Draw Nodes

Draw nodes contain roto shapes, paint tools, film grain, fills, lens flares, sparkles, and other vector-based image tools.

## Dither

Dither adds random noise to an image to hide color quantization effects. Color quantization is a reduction in the number of colors used in the image, and can occur, for example, if the image has been stored into an 8-bit file without error diffusion. In a dithered image, colors that are not available are approximated by a diffusion of colored pixels from within the available palette. The human eye perceives the diffusion as a mixture of the colors within it. This produces an impression of a larger number of colors and eliminates banding artifacts.

See also [Noise](#), [Grain](#), [ScannedGrain](#), and [F\\_ReGrain](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence with unwanted color quantization effects.                                                                                                                                                                                                                                                                                                                   |
|                 | mask            | <p>An optional image to use as a mask. By default, the dither effect is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                              |
|--------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dither Tab   |                  |               |                                                                                                                                                                                                       |
| channels     | channels         | all           | <p>The effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> |
| amount       | amount           | 0.1           | Up to 0.5 of this amount is added or subtracted from each pixel to create the effect. Higher values produce more dither and vice versa.                                                               |
| monodither   | monodither       | disabled      | When enabled, the same dithering pattern is used for all channels.                                                                                                                                    |
| seed         | seed             | 1             | The same pattern is usually produced for each Dither node. Changing the <b>seed</b> number produces a different pattern, for instance if you're using multiple Dither nodes.                          |
| static seed  | static_seed      | disabled      | When enabled, the dither pattern remains the same for every frame producing a constant dither effect.                                                                                                 |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                         |
|              | maskChannelInput | none          | The channel to use as a mask. By default, the dither effect is limited to the non-black areas of this channel.                                                                                        |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                          |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel so that the dither effect is limited to the non-white areas of the mask.                                                                                          |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.                                                                                                                                          |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                |                  |               | When disabled, the effect is applied to the entire mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|                | unpremult        | none          | <p>The image is divided by this channel before being processed, and multiplied again afterwards.</p> <p>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate applying the dither before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one Dither node.</p> <p>If you are using unpremultiplied input images, you should leave this set to <b>none</b>.</p> |
| invert         | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| mix            | mix              | 1             | Dissolves between the original image at 0 and the full dither effect at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

# DustBust

DustBust allows you to remove dirt and scratches from scanned images by painting over them with pixels from another frame or another part of the same frame. It clones multiple areas from a source to a destination based on dust points you create by **Ctrl/Cmd**+clicking in the Viewer. The source position can be different for each dust point.

See also [RotoPaint](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                        |
|-----------------|-----------------|-------------------------------------------------|
| Input           | unnamed         | The image with the dirt or scratches to remove. |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                        |

| enable        | enable           | 1             | Sets the effect intensity from 0-1, where 1 is equal to the full effect.                                                                                                                                                                                                                                                                                        |
| view source   | view_source      | disabled      | When enabled, you can view the source frame for the points currently in the Viewer.                                                                                                                                                                                                                                                                             |
| frame offset  | frame_offset     | 1             | <p>The clone source can be on the same frame (value 0) or on another frame determined by the frame offset.</p> <div>  <b>Note:</b> Frame offset is the same to all dust points on a particular frame (but frame offset can be animated over time if desired).         </div> |
| edge hardness | edge_hardness    | 0.5           | Sets the edge softness for all dust points on a particular frame.                                                                                                                                                                                                                                                                                               |
| Output Mask   | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                   |
|               | maskchannel      | none          | The channel to use as a mask. By default, the effect is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                         |

# Flare

This node simulates lens flares that are created by reflections between lenses inside a film or video camera when the camera is pointed towards a bright light source, such as the sun. Lens flares are typically added to compositions to create a sense of realism, implying that the image is an un-edited shot of a real life scene.

Lens flares are generally round, oval, or roundish with five or six flattened sides. They tend to show chroma shifting, generating rainbow-like outlines. Nuke flares are implemented as a donut-like shape. They have three radii:

- The outer radius is the outside of the donut.
- The middle radius is the thickest part.
- The inner radius is where the donut hole would be.

You can define two colors for the flare: the color of the donut itself and the fill color for the donut hole. If these two colors are the same, flares are rendered as disks.

|               |                  |               | image at 0 and the <b>position</b> , or light source, at 1.                                                                                                                                                                                                                                                                                                              |
| radius        | radius           | 80, 100, 120  | <p>Sets the size of the flare as described by three radii:</p> <ul style="list-style-type: none"> <li>• <b>inner</b> - sets the size of the 'hole' filled by the <b>inner color</b> control.</li> <li>• <b>middle</b> - sets the thickness of the donut filled by the <b>ring color</b> control.</li> <li>• <b>outer</b> - sets the outer limit of the donut.</li> </ul> |
| size mult     | size_mult        | 1             | Scales the flare globally, while retaining the ratio described by the <b>radius</b> controls.                                                                                                                                                                                                                                                                            |
| anamorph      | anamorph         | 1             | Simulates anamorphic lens flares by altering the default 1:1 flare shape.                                                                                                                                                                                                                                                                                                |
| Colors        |                  |               |                                                                                                                                                                                                                                                                                                                                                                          |
| ring color    | ring_color       | 1             | Sets the ring color of the flare donut. Flares fade from black at the <b>outer</b> radius to the ring color on the <b>middle</b> radius.                                                                                                                                                                                                                                 |
| inner color   | inner_color      | 0.5           | Sets the inner color of the flare donut. Flares fade from the ring color on the <b>middle</b> radius to the inner color on the <b>inner</b> radius.                                                                                                                                                                                                                      |
| outer falloff | outer_falloff    | 1             | Sets the blending or falloff between the outer radius and the background image.                                                                                                                                                                                                                                                                                          |
| inner falloff | inner_falloff    | 1             | Sets the blending or falloff between the inner radius and the background image.                                                                                                                                                                                                                                                                                          |
| Color Shifts  |                  |               |                                                                                                                                                                                                                                                                                                                                                                          |
| chroma spread | chroma_spread    | 0             | <p>Moves chroma spread to and from the center of the flare. Positive values shift red outward and blue inward, and vice versa.</p> <p><b>Note:</b> You can use the color <b>inner</b> and <b>outerfalloff</b> controls to compensate for banding created by large <b>chroma spread</b> values.</p>                                                                       |

| Control (UI) | Knob (Scripting)       | Default Value | Function                                                                                                                                                                                                                                                                                                          |
|--------------|------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chroma shift | chroma_shift           | 0             | Moves color components in the direction specified in the <b>angle</b> control.                                                                                                                                                                                                                                    |
| angle        | chroma_shift_angle     | 0             | Sets the direction of <b>chroma shift</b> . Positive values rotate the shift counter-clockwise and vice versa.                                                                                                                                                                                                    |
| rel          | chroma_shift_angle_add | disabled      | When enabled, <b>angle</b> is relative to the light angle (the angle between <b>position</b> and the center point of the image).                                                                                                                                                                                  |
| Visibility   |                        |               |                                                                                                                                                                                                                                                                                                                   |
| brightness   | brightness             | 1             | Adjusts the overall brightness of the flare.<br><br>Setting this value to 0 makes the flare invisible.                                                                                                                                                                                                            |
| in           | vis_in                 | 1             | Sets the relative distance from the light source to the matte, at which the flare is fully visible.                                                                                                                                                                                                               |
| out          | vis_out                | 1.1           | Sets the relative distance from the light source to the matte, at which the flare is fully invisible.                                                                                                                                                                                                             |
| mask         | N/A                    | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                     |
|              | vis_mask               | none          | The channel to use as a visibility mask. The lens flare effect is limited to the non-black areas of this channel.<br><br>Where the visibility mask is white, the full <b>brightness</b> value is used. Where the mask is black, <b>brightness</b> is set to 0 (invisible). Gray areas are attenuated accordingly. |
| mask blur    | vis_mask_size          | 4             | When a visibility mask is used, the mask is blurred by this radius.                                                                                                                                                                                                                                               |
| Shape        |                        |               |                                                                                                                                                                                                                                                                                                                   |
| corners      | corners                | 5             | If <b>edge flattening</b> is set to a value greater than 0, this controls the number of sides that make up the polygonal flare.                                                                                                                                                                                   |

| Control (UI)     | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                |
|------------------|-------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| edge flattening  | flattening        | 0             | Simulates polygonal flares that some physical lens flares create. The default value of 0 creates a circular flare. Higher values push the sides toward the center of the flare, creating a star shape at values past 1. |
| corner sharpness | sharpness         | 0.5           | Adjusts the sharpness of the angles created with <b>edgeflattening</b> .                                                                                                                                                |
| angle            | corners_angle     | 0             | Sets the position of the first corner of a polygonal flare. Positive values rotate the first corner counter-clockwise and vice versa.                                                                                   |
| rel              | corners_angle_add | disabled      | When enabled, <b>angle</b> is relative to the light angle (the angle between <b>position</b> and the center point of the image).                                                                                        |
| Multi Tab        |                   |               |                                                                                                                                                                                                                         |
| Asymmetry        |                   |               |                                                                                                                                                                                                                         |
| repeat           | asym_repeat       | 1             | Sets the number of darkened sections around the circumference of the flare.                                                                                                                                             |
| multiplier       | asym_multiplier   | 1             | Sets how dark the darkened sections are. The default value of 1 creates no darkening, whereas a value of 0 sets the darkened sections to black.                                                                         |
| falloff          | asym_falloff      | 1             | Sets the falloff at the edges of the darkened sections. The higher the value, the wider the darkened sections.                                                                                                          |
| angle            | asym_angle        | 0             | Rotates the darkened sections around the center of the flare. Positive values rotate the sections counter-clockwise and vice versa.                                                                                     |
| Multiple Flares  |                   |               |                                                                                                                                                                                                                         |
| repeat           | mult_num          | 1             | Creates multiple flares with similar attributes. These are randomized according to the controls below. You can affect multiple flares by adjusting the <b>overall seed</b> or by setting seeds for individual controls. |
| overall seed     | mult_seed         | 0             | Sets the overall seed for all attributes on all repeat flares.                                                                                                                                                          |

| Control (UI)  | Knob (Scripting)     | Default Value | Function                                                                                                                                      |
|---------------|----------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
|               |                      |               | This produces random attributes for each flare. Change the value to randomly vary the attributes.                                             |
| random offset | mult_offset          | 1             | Randomly varies the offsets for all repeat flares along the line from the image center to <b>position</b> .                                   |
|               | mult_offset_seed     | 48235         | Randomly varies the offsets for all repeat flares. You can tie <b>Multiple Flare</b> controls together by giving them the same value here.    |
| size          | mult_size            | 0             | Randomly varies the sizes of all repeat flares.<br><br>Positive values scale the flares down and vice versa.                                  |
|               | mult_size_seed       | 94335         | Randomly varies the sizes of all repeat flares. You can tie <b>Multiple Flare</b> controls together by giving them the same value here.       |
| hue           | mult_color           | 0             | Randomly varies the colors of all repeat flares.<br><br>Positive values move the hue towards blue and negative values toward red.             |
|               | mult_color_seed      | 77088         | Randomly varies the colors of all repeat flares. You can tie <b>Multiple Flare</b> controls together by giving them the same value here.      |
| brightness    | mult_brightness      | 0             | Randomly varies the brightness for all repeat flares.<br><br>Positive values increase the flare brightness and vice versa.                    |
|               | mult_brightness_seed | 75021         | Randomly varies the brightness for all repeat flares. You can tie <b>Multiple Flare</b> controls together by giving them the same value here. |
| visibility    | mult_visibility      | 0             | Randomly varies the visibility for all repeat flares.<br><br>Positive values increase the flare opacity and vice versa.                       |
|               | mult_visibility_seed | 68995         | Randomly varies the visibility for all repeat flares. You can tie <b>Multiple Flare</b> controls together by giving them the                  |

| Control (UI)    | Knob (Scripting)     | Default Value | Function                                                                                                                                                                                             |
|-----------------|----------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                      |               | same value here.                                                                                                                                                                                     |
| edge flattening | mult_flattening      | 0             | Randomly varies the edge flattening for all repeat flares.<br><br>Positive values push the sides toward the center of the flare. Negative values push the sides out, creating a more circular flare. |
|                 | mult_flattening_seed | 45203         | Randomly varies the edge flattening for all repeat flares. You can tie <b>Multiple Flare</b> controls together by giving them the same value here.                                                   |
| rotation        | mult_rotate          | 0             | Randomly varies the rotation for all repeat flares.<br><br>Positive values rotate the flare clockwise and vice versa.                                                                                |
|                 | mult_rotate_seed     | 49429         | Randomly varies the rotation for all repeat flares. You can tie <b>Multiple Flare</b> controls together by giving them the same value here.                                                          |

| all          | all              | N/A           | Removes all preset flares and resets all Flare node controls to their defaults.                  |

# Glint

With the Glint node, you can create star-shaped rays around all the bright points in an image.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to receive the star-shaped rays.                                                                                                                                                                                                                                                                                                                                  |
|                 | mask            | <p>An optional image to use as a mask. By default, the star-shaped rays are limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as a triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                         |
|----------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Glint Tab      |                  |               |                                                                                                                                                                                                                  |
| channels       | channels         | all           | <p>The star-shaped rays are only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> |
| no. of rays    | repeat           | 2             | The number of rays coming out of the bright points in your image. For example, if you want to create five-pointed stars, enter 5 here.                                                                           |
| length         | length           | 50            | Sets the length of the rays.                                                                                                                                                                                     |
| aspect ratio   | aspect           | 1             | Sets the aspect ratio of the star-shapes.                                                                                                                                                                        |
| odd ray length | oddlen           | 1             | Gives every other ray a different length and sets that length.                                                                                                                                                   |
| rotation       | rotation         | 0             | Rotates the star-shapes by degrees. Negative values produce anti-clockwise rotation.                                                                                                                             |
| from color     | from_color       | 1             | Sets the color in the beginning of the rays near the center point of the stars.                                                                                                                                  |
| to color       | to_color         | 0             | Sets the color in the end of the rays.                                                                                                                                                                           |
| steps          | steps            | 5             | Sets how many steps the rays are formed of. The more steps you use and the shorter the rays are, the smoother the rays become.                                                                                   |
| max            | max              | enabled       | <p>When enabled, the brightest image forming the rays is used.</p> <p>When disabled, the images forming the rays are added up.</p>                                                                               |
| effect only    | effect_only      | disabled      | When enabled, only outputs the effect without merging it with the original input image.                                                                                                                          |
| w              | N/A              | disabled      | Enables the associated <b>w</b> channel to the right.                                                                                                                                                            |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                              |
|              | w_channel        | none          | <p>The channel to use as a mask for what are considered glint sources. Highlights in the non-black areas of this channel cause the glint effect, whereas highlights in the non-white areas do not.</p> <p>This is different from the <b>mask</b> channel in that the glint effect can extend outside the matte in this channel as long as the highlights that cause the effect are inside the matte.</p> |
| tolerance    | tolerance        | 0.5           | <p>Sets the threshold for how bright the highlights in the input image need to be to cause the glint effect. Only pixels above the threshold will bloom with the effect.</p> <p>Low values produce more glint than high values.</p>                                                                                                                                                                      |
| gamma        | gamma            | 1             | Lets you perform a gamma correction on the highlights that cause glint before the glint effect is applied.                                                                                                                                                                                                                                                                                               |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                            |
|              | maskChannelInput | none          | The channel to use as a mask. By default, the effect is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                                                                  |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                                                             |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel, so that the transform is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.                                                                                                                                                                                                                                                                                                                                             |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                            |
|--------------|------------------|---------------|---------------------------------------------------------------------|
|              |                  |               | When disabled, the effect is applied to the entire mask.            |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1. |

# Grain

The Grain node lets you add synthetic grain (rather than grain derived from actual film stock) to an image. This helps you ensure that all of the elements in your composite, including those which were digitally generated, look like they were shot on the same film stock.

The **presets** dropdown menu includes predefined types of grain, such as **Kodak 5248** and **Kodak 5218**. These are the correct size for 2K scans.

You can also adjust the Grain node's controls to match a sample piece of grain:

1. Find a sample with a rather constant background.
2. Blur the sample to remove the grain.
3. Connect the blurred sample to the Grain node's input.
4. In the Viewer, wipe between the Grain node and the original sample image, and adjust the Grain node's controls to match the grain. It helps to view and match each of the red, green, and blue channels separately.

See also [ScannedGrain](#) and [F\\_ReGrain](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                  |
|-----------------|-----------------|-------------------------------------------|
| Input           | 1               | The image sequence to receive the effect. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                             |
|--------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Mask                     |                  |               |                                                                                                                                                                                                                                                                                 |
| Apply only through alpha | maskgrain        | enabled       | <p>When enabled, effect is limited to the non-black areas of the image's alpha channel. This can be useful when you want to apply grain to premultiplied CG images without contaminating the background black.</p> <p>When disabled, effect is applied to the entire image.</p> |
| Invert alpha             | invert_mask      | disabled      | Inverts the use of the alpha channel, so that when <b>Apply only through alpha</b> is enabled, the effect is limited to the non-white areas of the alpha.                                                                                                                       |

# Grid

This node creates a grid of horizontal and vertical lines on top of the input image.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image on which the grid is superimposed.                                                                                                                                                                                                                                                                                                                          |
|                 | mask            | <p>An optional image to use as a mask. By default, the grid is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                             |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | incoming format area.                                                                                                                                                                                                                                                |
| replace      | replace          | disabled      | When enabled, existing channels are cleared to black before drawing into them. You might find <b>replace</b> useful, for instance, if you're creating a mask in the alpha channel, but the incoming image already has an alpha channel which you want to throw away. |
| invert       | invert           | disabled      | When enabled, inverts the grid (that is, fills in the holes in the grid and leaves holes for the lines).                                                                                                                                                             |
| opacity      | opacity          | 1             | Adjusts the grid opacity on a sliding scale, where 0 is completely transparent and 1 is completely opaque.                                                                                                                                                           |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                        |
|              | maskChannelInput | none          | The channel to use as a mask. By default, the grid is limited to the non-black areas of this channel.                                                                                                                                                                |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                         |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel, so that grid is limited to the non-white areas of the mask.                                                                                                                                                                     |
| number       | number           | 10            | Sets the number of grid squares on the x and y axes.                                                                                                                                                                                                                 |
| size         | size             | 1             | Sets the grid line thickness in pixels.                                                                                                                                                                                                                              |
| translate    | translate        | 0, 0          | Translates the entire grid on the x and y axes.                                                                                                                                                                                                                      |
| Color Tab    |                  |               |                                                                                                                                                                                                                                                                      |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

This allows you to adjust the spread and angle of the ramp.</p> <p>This control is only available if <b>ramp</b> is set to anything other than <b>none</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

# LightWrap

LightWrap can help composite objects into a very bright background by 'wrapping' or spilling light from the background onto the foreground object. The node creates a reflection of light around the edges of your foreground object by blending in whatever is in the background.

You should apply LightWrap on your foreground element before you composite the foreground over the background with the Merge node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                      |
|-----------------|-----------------|---------------------------------------------------------------|
| Input           | A               | The foreground image.                                         |
|                 | B               | A background that will bleed light into the foreground image. |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LightWrap Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Diffuse       | size             | 15            | Adjusts the spread of the reflections on the foreground element. This and <b>Intensity</b> need to be balanced out together. You may want to start by bringing <b>Diffuse</b> all the way down to better see what you are blending in from the background. Then, adjust <b>Intensity</b> before going back to the <b>Diffuse</b> slider and, if necessary, <b>Intensity</b> again until you are happy with the result. |
| Intensity     | Intensity        | 0             | Adjusts the brightness of the reflections on the foreground element. This and <b>Diffuse</b> need to be balanced out together. You may want to start by bringing <b>Diffuse</b> all the way down to better see what                                                                                                                                                                                                    |

| Control (UI)                 | Knob (Scripting) | Default Value | Function                                                                                                                                                                                             |
|------------------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                              |                  |               | you are blending in from the background. Then, adjust <b>Intensity</b> before going back to the <b>Diffuse</b> slider and, if necessary, <b>Intensity</b> again until you are happy with the result. |
| Generate wrap only           | onlywrap         | disabled      | When enabled, generates the LightWrap effect only, without merging it with the foreground object.                                                                                                    |
| Disable luminance based wrap | disableluma      | disabled      | When enabled, creates a uniform effect around the edges of the foreground, rather than have the effect adjust itself according to the background.                                                    |
| Enable Glow                  | enableglow       | disabled      | When enabled, extends the effect outside the foreground object's alpha, making the object seem to glow.                                                                                              |
| FGBLur                       | FGBLur           | 1             | Sets how much the foreground matte is blurred. The more blur, the more of the background is added to the foreground.                                                                                 |
| BGBLur                       | BGBLur           | 0             | Sets how much the background is blurred before it is merged with the foreground element.                                                                                                             |
| Saturation                   | saturation       | 1             | Adjusts the saturation of the LightWrap effect.                                                                                                                                                      |
| LumaTolerance                | LumaTolerance    | 0             | Adjusts the luminance values of the LightWrap effect.                                                                                                                                                |
| Highlight Merge              | highlightmerge   | plus          | Sets how the foreground object is merged with the background. The default merge operation, <b>plus</b> , adds the elements together, producing a glow effect.                                        |
| Use constant highlight       | useconstant      | disabled      | When enabled, a constant color of your choice rather than the background is used in the LightWrap effect. Select the color using the <b>Constant</b> control.                                        |
| Constant                     | color            | 1             | Sets the color to use in the LightWrap effect when <b>Use constant highlight</b> is enabled.                                                                                                         |
| CCorrect Tab                 |                  |               |                                                                                                                                                                                                      |
| white                        | white            | 1             | This color remains unchanged when you adjust <b>gamma</b> .                                                                                                                                          |

| Control (UI) | Knob (Scripting)  | Default Value | Function                                                                           |
|--------------|-------------------|---------------|------------------------------------------------------------------------------------|
| midtone bias | gray              | 0.18          | Sets the center of midtones, remaining unchanged when you adjust <b>contrast</b> . |
| master       |                   |               |                                                                                    |
| contrast     | contrast          | 1             | Adjusts the contrast in the entire LightWrap effect.                               |
| gamma        | gamma             | 1             | Adjusts the gamma in the entire LightWrap effect.                                  |
| gain         | gain              | 1             | Adjusts the gain in the entire LightWrap effect.                                   |
| offset       | offset            | 0             | Adjusts the offset in the entire LightWrap effect.                                 |
| shadows      |                   |               |                                                                                    |
| gamma        | shadows_gamma     | 1             | Adjusts the gamma in the darkest parts of the LightWrap effect.                    |
| gain         | shadows_gain      | 1             | Adjusts the gain in the darkest parts of the LightWrap effect.                     |
| offset       | shadows_offset    | 0             | Adjusts the offset in the darkest parts of the LightWrap effect.                   |
| midtones     |                   |               |                                                                                    |
| gamma        | midtones_gamma    | 1             | Adjusts the gamma in the middle range of the LightWrap effect.                     |
| gain         | midtones_gain     | 1             | Adjusts the gain in the middle range of the LightWrap effect.                      |
| offset       | midtones_offset   | 0             | Adjusts the offset in the middle range of the LightWrap effect.                    |
| highlights   |                   |               |                                                                                    |
| gamma        | highlights_gamma  | 1             | Adjusts the gamma in the highlights of the LightWrap effect.                       |
| gain         | highlights_gain   | 1             | Adjusts the gain in the highlights of the LightWrap effect.                        |
| offset       | highlights_offset | 0             | Adjusts the offset in the highlights of the LightWrap                              |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                  |
|--------------|------------------|---------------|-------------------------------------------------------------------------------------------|
|              |                  |               | effect.                                                                                   |
| mix          | mix              | 1             | Dissolves between the original LightWrap effect at 0 and the color corrected effect at 1. |

# MarkerRemoval

MarkerRemoval uses roto shapes to mask an area of the footage that you don't want to appear in the final result, typically small areas like tracking markers. Nuke automatically paints the masked area with suitable pixels sampled from the background plate.

**Note:** Painted pixels with values of 0.5 mean the algorithm was unable to locate any pixel to fill in.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                 |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The node supplying the mask information, for example <a href="#">Roto</a> or <a href="#">RotoPaint</a> . |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                               |
|-------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MarkerRemoval Tab |                  |               |                                                                                                                                                                                                                                                                                                        |
| paint type        | mode             | bilinear      | Sets the paint mode used to fill the roto shape(s): <ul style="list-style-type: none"> <li>• <b>bilinear</b> - extrapolates pixels on the xy axes to fill the roto shape(s).</li> <li>• <b>radial</b> - extrapolates pixels radially outward from a center point to fill the roto shape(s).</li> </ul> |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   |                  |               |  <b>Note:</b> The center point is averaged between the number of roto shapes, so <b>radial</b> painting with more than one roto shape is not recommended. When using the <b>radial</b> mode, you should only use one roto shape for each MarkerRemoval node.                                                                                                         |
| bilinear y search | linearsearch     | 100           | <p>Sets the height (in pixels) used to search for suitable pixels to fill the roto shape.</p> <p>This value should always be higher than the height of the roto mask surrounding the area you want to fill, and should only be increased for large mask areas.</p>  <b>Note:</b> This option is only available when the <b>painttype</b> is set to <b>bilinear</b> . |
| control channel   |                  | enabled       | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> , effectively disabling the node.                                                                                                                                                                                                                                                                                              |
|                   | ctrlMask         | rgba.alpha    | The channel that contains the roto mask(s).                                                                                                                                                                                                                                                                                                                                                                                                           |
| Pixel offset      |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| x offset          | x_offset         | 0             | If the roto shape mask you intend to use is close to the <b>left</b> or <b>right</b> edges of the plate, you can offset the sample area by a specified number of pixels to create a more accurate fill for the roto shape.                                                                                                                                                                                                                            |
| y offset          | y_offset         | 0             | If the roto shape mask you intend to use is close to the <b>top</b> or <b>bottom</b> edges of the plate, you can offset the sample area by a specified number of pixels to create a more accurate fill for the roto shape.                                                                                                                                                                                                                            |

# Noise

Adds various types of seemingly random noise to the input image, all based on the Perlin noise function.

See also [Grain](#), [ScannedGrain](#), and [F\\_ReGrain](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to which noise is added.                                                                                                                                                                                                                                                                                                                            |
|                 | mask            | <p>An optional image to use as a mask. By default, the noise is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                               |
|--------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Noise Tab    |                  |               |                                                                                                                                                                                                                                                                                                        |
| output       | output           | rgba          | <p>The noise is rendered into these output channels.</p> <p>If you set this to something other than <b>none</b>, you can use the checkboxes on the right to select individual channels.</p>                                                                                                            |
| premult      | premult          | none          | <p>Premultiply multiplies the chosen input channels with a mask representing the noise. For example, where there is no noise (the matte is black or empty), the input channels are set to black. Where the noise is opaque (the matte is white or full), the input channels keep their full value.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               |  <b>Note:</b> Selecting <b>rgba</b> premultiplies the alpha against itself ( $a*a$ ). If you don't want this to happen, set <b>premult</b> to <b>rgb</b> instead.                                                                                                                                                                                                                                                                                                                                  |
| clip to      | cliptype         | format        | <p>Select how to restrict the output image:</p> <ul style="list-style-type: none"> <li>• <b>no clip</b> - use the entire image.</li> <li>• <b>bbox</b> - restrict the output image to the incoming bounding box.</li> <li>• <b>format</b> - restrict the output image to the incoming format area.</li> <li>• <b>unionbboxandformat</b> - restrict the output image to a combination of the incoming bounding box and format area.</li> <li>• <b>intersectbboxandformat</b> - restrict the output image to an intersection of the bounding box and incoming format area.</li> </ul> |
| replace      | replace          | disabled      | When enabled, existing channels are cleared to black before drawing into them. You might find <b>replace</b> useful, for instance, if you're creating a mask in the alpha channel, but the incoming image already has an alpha channel which you want to throw away.                                                                                                                                                                                                                                                                                                                |
| invert       | invert           | disabled      | When enabled, inverts the new noise and non-noise areas.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| opacity      | opacity          | 1             | Sets the noise opacity where 0 is equal to transparent, and 1 is equal to opaque.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|              | maskChannelInput | none          | The channel to use as a mask. By default, the noise is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Control (UI)          | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       |                  |               | channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                                                                                                                       |
| invert                | invert_mask      | disabled      | Inverts the use of the mask channel so that the noise is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                  |
| type                  | type             | fBm           | Choose the type of noise to use: <ul style="list-style-type: none"> <li>• <b>fBm</b> (fractional Brownian motion) - runs noise() octave times at different scales to get random numbers between -1 and +1 and adds them up.</li> <li>• <b>turbulence</b> - similar to <b>fBm</b> except it uses the absolute value of the noise function so the values it sums up are all between 0 and 1.</li> </ul> |
| x/y size              | size             | 350           | Sets the lowest possible noise frequency on the x and y axes. For example, low y values relative to x produces horizontal noise.                                                                                                                                                                                                                                                                      |
| z                     | zoffset          | 0             | Offsets the noise to create new patterns. This control must be animated to produce noise changes over time. For example, the expression <i>frame/10</i> causes the noise to change completely over 10 frames.                                                                                                                                                                                         |
| octaves               | octaves          | 10            | Sets the number of Perlin noise functions to add to the noise frequency.                                                                                                                                                                                                                                                                                                                              |
| clip at Nyquist limit | nyquist          | enabled       | When enabled, limits the number of octaves so that the highest frequency is larger than one pixel. <div>  <b>Note:</b> You may need to disable this control if you're animating the size of the noise, as changes can be visible. </div>                                                                           |
| lacunarity            | lacunarity       | 2             | Sets the amount by which octaves multiply noise frequency. Lower values produce smoother noise and higher values produce more granular noise.                                                                                                                                                                                                                                                         |
| gain                  | gain             | 0.5           | Sets the amount by which octaves multiply noise                                                                                                                                                                                                                                                                                                                                                       |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                  |               | amplitude.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| gamma         | gamma            | 0.5           | Sets the gamma output for the noise.                                                                                                                                                                                                                                                                                                                                                                                          |
| Transform Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                               |
| translate xy  | translate        | 0, 0          | Translates the noise along the x and y axes. You can also adjust translate values by dragging the transform handle in the Viewer.                                                                                                                                                                                                                                                                                             |
| rotate        | rotate           | 0, 0          | Rotates the noise around the <b>center x y</b> coordinates. You can adjust rotate values by dragging the transform handle in the Viewer.                                                                                                                                                                                                                                                                                      |
| scale         | scaling          | 1             | Scales the noise width and height around the <b>center x y</b> coordinates.                                                                                                                                                                                                                                                                                                                                                   |
| skew          | skew             | 0             | Skews the noise on the x and y axes.                                                                                                                                                                                                                                                                                                                                                                                          |
| center xy     | center           | N/A           | Sets the center of rotation and scale on the x and y axes.                                                                                                                                                                                                                                                                                                                                                                    |
| xrotate       | xrotate          | 30            | Rotation around the x axis in 3D noise space. Setting this to zero reveals artifacts in the Perlin noise generator.                                                                                                                                                                                                                                                                                                           |
| yrotate       | yrotate          | 30            | Rotation around the y axis in 3D noise space. Setting this to zero reveals artifacts in the Perlin noise generator.                                                                                                                                                                                                                                                                                                           |
| Color Tab     |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                               |
| ramp          | ramp             | none          | <p>Selects whether to create a color gradient across the noise:</p> <ul style="list-style-type: none"> <li>• <b>none</b> - don't create a color gradient.</li> <li>• <b>linear</b> - the ramp changes linearly from one color into another.</li> <li>• <b>smooth0</b> - the ramp color gradually eases into the point 0 end. This means colors in the point 0 end are spread wider than colors in the point 1 end.</li> </ul> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                  |

| replace          | replace          | disabled      | When enabled, existing channels are cleared to black before drawing into them. You might find <b>replace</b> useful, for instance, if you're creating a mask in the alpha channel, but the incoming image already has an alpha channel which you want to throw away.                                                                                                                                                                                                              |
| invert           | invert           | disabled      | When enabled, inverts the radial ramp and non-radial ramp areas.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| opacity          | opacity          | 1             | Sets the radial ramp opacity. 0 is equal to transparent and 1 is equal to opaque.                                                                                                                                                                                                                                                                                                                                                                                                 |
| mask             | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                     |
|                  | maskChannelInput | none          | The channel to use as a mask. By default, the ramp is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                                                                                                                                             |
| inject           | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                                                                                                                                      |
| invert           | invert_mask      | disabled      | Inverts the use of the mask channel so that the radial ramp is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                                                                                        |
| area xyrt (xywh) | area             | N/A           | Sets the area in which the radial ramp is contained. The center of the <b>area</b> control is the originating point                                                                                                                                                                                                                                                                                                                                                               |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

# Ramp

Generates a gradation between two defined edges. This node is included for backward compatibility - other Draw nodes, such as Rectangle, have their own Ramp controls.

See also [Radial](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to which the ramp is added.                                                                                                                                                                                                                                                                                                                  |
|                 | mask            | An optional image to use as a mask. By default, the ramp is limited to the non-black areas of the mask.<br><br>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b> . |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| color        | color            | 1             | Sets a color for the ramp.                                                                                                      |

# Rectangle

Generates a rectangle in a solid color on top of the input image.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to which the rectangle is added.                                                                                                                                                                                                                                                                                                                  |
|                 | mask            | An optional image to use as a mask. By default, the rectangle is limited to the non-black areas of the mask.<br><br>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b> . |

| invert           | invert           | disabled      | When enabled, inverts the new rectangle and non-rectangle areas.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| opacity          | opacity          | 1             | Sets the rectangle opacity where 0 is equal to transparent, and 1 is equal to opaque.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| mask             | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                  | maskChannelInput | none          | The channel to use as a mask. By default, the rectangle is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| inject           | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                                                                                                                                                                                                             |
| invert           | invert_mask      | disabled      | Inverts the use of the mask channel so that the rectangle is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| area xyrt (xywh) | area             | N/A           | Sets the area of the rectangle.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| softness         | softness         | 1             | Sets the softness of the rectangle edges where 0 is a hard edge.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Color Tab        |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| ramp             | ramp             | none          | <p>Selects whether to create a color gradient across the rectangle:</p> <ul style="list-style-type: none"> <li>• <b>none</b> - don't create a color gradient.</li> <li>• <b>linear</b> - the ramp changes linearly from one color into another.</li> <li>• <b>smooth0</b> - the ramp color gradually eases into the point 0 end. This means colors in the point 0 end are spread wider than colors in the point 1 end.</li> <li>• <b>smooth1</b> - the ramp color eases into the point 1 end. This means colors in the point 1 end are spread</li> </ul> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                  |

# Roto

The Roto node is an optimal choice if you're doing rotoscoping only - it allows you to create and edit Bezier and B-spline shapes.

The toolbar on the left side of the Viewer includes point selection and manipulation, and shape creation tools. Click and hold or right-click on a toolbar button to open a sub-menu to select any of its available tool types. Options related to the current tool appear in a toolbar along the top of the Viewer. Click on a toolbar item to cycle through the available options for that class of tools.

As a general workflow guide:

1. Select your tool from the left-hand Viewer tool bar.
  2. Use the Roto tool settings above the Viewer to adjust the tool's properties.
  3. Draw your shape or shapes:
    - Click in the Viewer to place points. You can drag while clicking to pull out Bezier handles or adjust B-Spline tension.
    - **Ctrl/Cmd**+drag to sketch the shape freely.
    - To close the shape, click the first point or press **Return**. To leave the shape open, press **Esc**.
    - **Ctrl/Cmd+Alt**+click to add points to an existing shape.
    - To increase the smoothness of a point, select the point and press **Z**.
    - To cusp a point, select the point and press **Shift+Z**.
    - To delete a point, select the point and press **Delete**.
    - Beziers: **Shift**+drag on a tangent handle to snap the opposite handle to the same length.  
**Ctrl/Cmd**+drag on a tangent handle to move it independently of its opposite handle.
    - B-Splines: **Ctrl/Cmd+Alt**+drag on a point to adjust its tension.
  4. Select a shape using the **Select** tools or the shape list in the control panel.
  5. Use the control panel to adjust or fine-tune your shape(s).
- You can also create this node by pressing **O** on the Node Graph.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                         |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------|
| Input           | bg              | Background input - adding a background automatically creates another <b>bg</b> input, allowing you to connect up to four images. |

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | mask            | <p>An optional image to use as a mask. By default, the roto shapes are limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as a triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| visible              | visible          | enabled       | Sets whether the selected shape or group is visible and rendered or not. You can still edit an invisible shape and view its position in the Viewer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| locked               | locked           | disabled      | Locks the selected shape or group to prevent it from being edited.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| view                 | view             | N/A           | The view(s) in which you want to draw your shape(s). This is only displayed if you have set up more than one view in your Project Settings (typically, if you're working on a stereoscopic project).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| stereo offset<br>x,y | stereo_offset    | 0             | <p>Moves the selected shape or group on the x and y axes. This is an extra transform that is applied after all other transforms. Typically, you would position the shape or group correctly in the hero view, then split this control, and drag the shape to its correct location in any other views. Note that you can also press <b>Shift</b> while dragging to constrain the movement to x or y axis only.</p> <p><b>Stereo offset</b> can be useful, for example, if you have a shape or group that is correctly positioned in one view and you want to move it to its correct location in another view, but can't use the <b>translate</b> control on the <b>Transform</b> tab because that's being driven by Tracker data.</p> <p>This control is only displayed if you have set up more than one view in your Project Settings (typically, if you're working on a stereoscopic project).</p> |
| shape list           | curves           | N/A           | Shows the hierarchy of shapes and groups, allowing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| motionblur     | motionblur                     | 1             | Sets the number of motion blur samples for the selected shape(s). Increase this for better quality but slower rendering, decrease it for faster rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| on             | motionblur_on                  | disabled      | When enabled, motion blur is applied to the selected shape(s).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| shutter        | motionblur_shutter             | 0.5           | Sets the number of frames the shutter stays open when motion blurring. For example, a value of 0.5 corresponds to half a frame. Increasing the value produces higher quality motion blur, but increases render time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| shutter offset | motionblur_shutter_offset_type | start         | Controls how the shutter behaves with respect to the current frame value. There are four options: <ul style="list-style-type: none"> <li>• <b>centred</b> - center the shutter around the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29,5 to 30,5.</li> <li>• <b>start</b> - open the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 30 to 31.</li> <li>• <b>end</b> - close the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29 to 30.</li> <li>• <b>custom</b> - open the shutter at the time you specify. In the field next to the dropdown menu, enter a value (in frames) you want to add to the current frame. To open the shutter before the current frame, enter a negative value. For example, a value of - 0.5 would open the shutter half a frame before the current frame.</li> </ul> |
| [offset]       | motionblur_shutter_offset      | 0             | If the shutter offset control is set to <b>custom</b> , this control is used to set the time that the shutter opens                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Control (UI)   | Knob (Scripting)                      | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| motionblur     | global_motionblur                     | 1             | Sets the number of motion blur samples for all shapes in the current Roto node. Increase this for better quality but slower rendering, decrease it for faster rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| shutter        | global_motionblur_shutter             | 0.5           | Sets the number of frames the shutter stays open when motion blurring. For example, a value of 0.5 corresponds to half a frame. Increasing the value produces higher quality motion blur, but increases render time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| shutter offset | global_motionblur_shutter_offset_type | start         | <p>Controls how the shutter behaves with respect to the current frame value. There are four options:</p> <ul style="list-style-type: none"> <li>• <b>centred</b> - center the shutter around the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29,5 to 30,5.</li> <li>• <b>start</b> - open the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 30 to 31.</li> <li>• <b>end</b> - close the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29 to 30.</li> <li>• <b>custom</b> - open the shutter at the time you specify. In the field next to the dropdown menu, enter a value (in frames) you want to add to the current frame. To open the shutter before the current frame, enter a negative value. For example, a value of - 0.5 would open the shutter half a frame before</li> </ul> |

# RotoPaint

RotoPaint is a vector-based node for help with tasks like rotoscoping, rig removal, garbage matting and dustbusting. You can draw Bezier and B-Spline shapes with individual and layer group attributes, including per-point and global feather, motion blur, blending modes and individual or hierarchical 2D transformations.

The RotoPaint node gives you a broader scale of tools to use than [Roto](#), though many of the controls are shared across both nodes. As with the Roto node, you should use the Viewer tools to create shapes and paint strokes, and then edit them using the control panel.

The toolbar on the left side of the Viewer has point selection and manipulation, and shape creation tools identical to Roto nodes. In addition, RotoPaint nodes also have brush, clone/reveal, blur, and dodge/burn tools. Click and hold or right-click on a toolbar button to open a sub-menu to select any of its available tool types. Options related to the current tool appear in a toolbar along the top of the Viewer. Click on a toolbar item to cycle through the available options for that class of tools.

As a general workflow guide:

1. Select your tool from the left-hand Viewer tool bar.
2. Use the RotoPaint tool settings above the Viewer to adjust the tool's properties.
3. When painting, you can:
  - **Shift**+drag on the Viewer to change brush size.
  - Clone tool: **Ctrl/Cmd**+click and drag to set the clone offset. To reset the clone offset, **Ctrl/Cmd**+**Shift**+click and drag.
4. When drawing your shapes, you can:
  - Click in the Viewer to place points. You can drag while clicking to pull out Bezier handles or adjust B-Spline tension.
  - **Ctrl/Cmd**+drag to sketch the shape freely.

- Click the first point or press **Return** to close the shape. To leave the shape open, press **Esc**.
  - **Ctrl/Cmd+Alt**+click to add points to an existing shape.
  - Select a point and press **Z** to increase the smoothness of the point.
  - Select the point and press **Shift+Z** to cusp the point.
  - Select the point and press **Delete** to delete a point.
  - Beziers: **Shift**+drag on a tangent handle to snap the opposite handle to the same length.  
**Ctrl/Cmd**+drag on a tangent handle to move it independently of its opposite handle.
  - B-Splines: **Ctrl/Cmd+Alt**+drag on a point to adjust its tension.
5. Select a shape or stroke using the **Select** tools or the shape/stroke list in the control panel.
  6. Use the control panel to adjust or fine-tune your shape(s) or stroke(s).
- You can also create this node by pressing **P** on the Node Graph.

|               |                  |               | <p>RotoPaint will output a mask for what it rendered.</p> <p>The mask can be useful, for example, if you need to apply grain to the areas you've painted, but you don't want to double up the gain in other areas.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| color         | color            | 1             | Sets the color for the roto shape or paint stroke. This control only has an effect when <b>source</b> is set to <b>color</b> on the <b>Shape</b> or <b>Stroke</b> tab.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| opacity       | opacity          | 1             | Sets the opacity of a new or existing shape or stroke in the shape/stroke list. 1 is equal to totally opaque and 0 is equal to transparent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| source        | paint_source     | color         | <p>Sets the source color for the selected shape/stroke:</p> <ul style="list-style-type: none"> <li>• <b>color</b> - the color specified in the <b>color</b> field.</li> <li>• <b>foreground</b> - pulls pixels from the <b>bg</b> input, including any shapes and strokes drawn on it. This input is mainly used with the <b>Clone</b> tab controls. Using it may cause slower renders.</li> <li>• <b>background</b> - pulls pixels from the <b>bg</b> input, not including any shapes and strokes drawn on it.</li> <li>• <b>backgrounds 1 to 3</b> - pulls pixels from <b>bg1</b>, <b>bg2</b>, and <b>bg3</b> inputs.</li> </ul>                               |
| blending mode | blending_mode    | over          | <p>Sets how the colors in the current shape (A) are merged with the underlying image and shapes (B):</p> <ul style="list-style-type: none"> <li>• <b>color-burn</b> (darken B towards A) - darkens B to reflect A by increasing the contrast. No part of the image becomes lighter.</li> <li>• <b>color-dodge</b> (brighten B towards A) - brightens B to reflect A by decreasing the contrast. No part of the image is darkened.</li> <li>• <b>difference</b> (abs(A-B)) - subtracts either B from A or vice versa, depending on which is brighter. Blending with white inverts A, while blending with black produces no change. Similar colors will</li> </ul> |

| Control (UI)              | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                           |                  |               | <p>return black pixels.</p> <ul style="list-style-type: none"> <li>• <b>exclusion</b> (<math>A+B-2AB</math>) - creates a result similar to the <b>difference</b> mode but lower in contrast. Like with <b>difference</b>, blending with white inverts A. Blending with black produces no change.</li> <li>• <b>from</b> (<math>B-A</math>) - subtracts A from B.</li> <li>• <b>hard-light</b> (multiply if <math>A &lt; .5</math>, screen if <math>A &gt; .5</math>) - lightens highlights and darkens shadows. If B is lighter than 50% gray, the result lightens as if it were screened. If B is darker than 50% gray, the result is darkened as if it were multiplied.</li> <li>• <b>max</b> (<math>\max(A,B)</math>) - selects the lighter of the two colors as the resulting color. Only areas darker than B are replaced, while areas lighter than B do not change.</li> <li>• <b>min</b> (<math>\min(A,B)</math>) - selects the darker of the two colors as the resulting color. Any parts that are lighter than B are substituted. Any parts of the image that are darker than B don't change.</li> </ul> |
| blending mode (continued) |                  |               | <ul style="list-style-type: none"> <li>• <b>minus</b> (<math>A-B</math>) - subtracts B from A.</li> <li>• <b>multiply</b> (<math>AB</math>, A if <math>A &lt; 0</math> and <math>B &lt; 0</math>) - multiplies A by B. The result is always darker. Blending with black gives black and with white returns the color unchanged.</li> <li>• <b>over</b> (A over B) - the colors of the two images will not interact in any way, and Nuke will display the full value of the colors in A.</li> <li>• <b>overlay</b> (multiply if <math>B &lt; .5</math>, screen if <math>B &gt; .5</math>) - depending on A, multiplies or screens the colors. B brightens A while preserving highlights and shadows.</li> <li>• <b>plus</b> (<math>A+B</math>) - the sum of the two colors. Increases brightness to lighten A and reflect B. Plus is similar to the <b>screen</b> blending mode, but produces a</li> </ul>                                                                                                                                                                                                         |

# ScannedGrain

Applies actual scans of film grain to replicate the grain of the film stock. Frames are selected from a loop of scanned film grain and applied to the input image. This allows you to add grain to CG creations to match the original plate or 'age' footage artificially.

See also [Grain](#) and [F\\_ReGrain](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to receive the grain.                                                                                                                                                                                                                                                                                                                                 |
|                 | mask            | <p>An optional image to use as a mask. By default, the grain is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as a triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)     | Knob (Scripting) | Default Value                        | Function                                                                                                                                                                                                                                                                                                                                  |

| grain            | fullGrain        | [file dir \$program_name]/FilmGrain/ | <p>Sets the file path of your scanned grain images.</p> <p>To create the film grain images:</p> <ol style="list-style-type: none"> <li>1. Film a gray card and scan the result to file.</li> <li>2. Blur the scanned image.</li> <li>3. Subtract the blurred image from the original.</li> <li>4. Add 0.5 to the rgb channels.</li> </ol> |

| Control (UI)    | Knob (Scripting)      | Default Value | Function                                                                                                                                                                                                                   |
|-----------------|-----------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                       |               | 5. Save the scanned grain image to the desired file type (.rgb for example).                                                                                                                                               |
| frame range     | fullGrain.first_frame | 1             | Sets the first frame of the grain file to use.                                                                                                                                                                             |
|                 | fullGrain.last_frame  | 50            | Sets the last frame of the grain file to use. Approximately 50 frames are required to produce random grain.                                                                                                                |
| min. width      | minwidth              | 721           | <p>Sets the minimum width (in pixels) that images must have in order for grain to be applied.</p> <p>Set a minimum width to ensure that the grain resolution matches the image otherwise you may get unwanted results.</p> |
| resize          | resize                | enabled       | <p>When enabled, resizes the <b>grain</b> plate to match your input.</p> <p>When disabled, the grain plate is cropped to match.</p>                                                                                        |
| flip            | flip                  | disabled      | Increases the number of grain images available by allowing random horizontal and vertical flipping of the grain plate. Flipping can produce a more random grain spread, but increases processing time.                     |
| offset          | offset                | 0.5           | Sets the value of neutral gray to subtract from images. The closer this value is to the input gray, the more grain is visible.                                                                                             |
| Amount of grain |                       |               |                                                                                                                                                                                                                            |
| amount rgb      | amount                | 0.30000001    | Sets the multiplier for the red channel applied to the grain.                                                                                                                                                              |

| Control (UI)          | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                           |
|-----------------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       |                  | 0.40000001    | Sets the multiplier for the green channel applied to the grain.                                                                                                                                                                                                                                    |
|                       |                  | 0.5           | Sets the multiplier for the blue channel applied to the grain.                                                                                                                                                                                                                                     |
| saturation            | saturation       | 1             | Sets the intensity of grain hue across all channels.                                                                                                                                                                                                                                               |
| use precomputed table | use_precomputed  | enabled       | <p>When enabled, the output LUT is clamped between 0 and 1. This control is enabled by default for backward compatibility.</p> <p>When disabled, Nuke does not clamp the LUT.</p>                                                                                                                  |
| curve editor          | weight           | N/A           | The <b>grain</b> sequence's color curves. You can use these to edit the gain, gamma, contrast, and so on for individual channels. You can also look up color information for the current pixel in the Viewer.                                                                                      |
| reset                 | N/A              | N/A           | Returns the selected curve(s) to the default values.                                                                                                                                                                                                                                               |
| low_clip              | low_clip         | 0             | <p>Sets the low threshold based on the input image.</p> <p>In general, when grain is added to an image, some input pixel values become higher, while others become lower. This control allows you to stop pixel values from going below a certain value, such as the blackpoint in your image.</p> |
| seed                  | seed             | 1             | <p>A different grain pattern is produced for each frame. Change this number to get a different initial pattern, for instance if you are using multiple <b>ScannedGrain</b> nodes.</p> <p>If you require an identical grain plate for every frame, enter <b>-frame</b> in this field.</p>           |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mask           | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                              |
|                | maskChannelInput | none          | The channel to use as a mask. By default, the grain is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| inject         | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                                                                                                                                                                                               |
| invert         | invert_mask      | disabled      | Inverts the use of the mask channel, so that grain is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| fringe         | fringe           | disabled      | <p>When enabled, only apply the effect to the edge of the mask.</p> <p>When disabled, the effect is applied to the entire mask.</p>                                                                                                                                                                                                                                                                                                                                                                                                        |
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                | unpremult        | none          | <p>The image is divided by this channel before being processed, and multiplied again afterwards.</p> <p>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate applying the grain before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one ScannedGrain node.</p> <p>If you are using unpremultiplied input images,</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                  |
|--------------|------------------|---------------|---------------------------------------------------------------------------|
|              |                  |               | you should leave this set to <b>none</b> .                                |
| invert       | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                           |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full grain effect at 1. |

# Sparkles

Creates customizable rays or sparkles from a central **position** indicator in the Viewer.

## Inputs and Controls

| Connection Type | Connection Name | Function                                    |
|-----------------|-----------------|---------------------------------------------|
| Input           | unnamed         | The image sequence to receive the sparkles. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                 |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sparkles Tab |                  |               |                                                                                                                                                                                                                                                                                          |
| Shape        |                  |               |                                                                                                                                                                                                                                                                                          |
| Sparkle type | mode             | Rays          | Sets the sparkle type to output from the <b>position</b> indicator in the Viewer: <ul style="list-style-type: none"> <li>• <b>Rays</b> - produces rays fading away from the origin.</li> <li>• <b>Sparkles</b> - produces intermittent rays fading at either end of each ray.</li> </ul> |

| Control (UI)    | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                         |
|-----------------|-------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                   |               | <ul style="list-style-type: none"> <li>• <b>Fireworks</b> - produces rays fading toward the origin.</li> </ul>                                                                                                                                                                                                   |
| triangle shapes | triangle_thick    | disabled      | When enabled, a triangle shape is used to create the rays increasing the thickness.                                                                                                                                                                                                                              |
| position xy     | position          | 700, 600      | Sets the center of origin for the rays on the x and y axes.                                                                                                                                                                                                                                                      |
| size            | size              | 300           | Sets the size of the rays, in pixels, and adjusts the ray bounding box accordingly. <div>  <b>Note:</b> When <b>Sparkle type</b> is set to <b>Sparkles</b>, this control determines the size of the longest ray.         </div> |
| anamorphic      | anamorphic        | 1             | Sets the anamorphic ratio of the bounding box. Negative values decrease width and vice versa.                                                                                                                                                                                                                    |
| rotation        | rotation          | 0             | Sets the amount of rotation applied to the rays. Negative values produce clockwise rotation and vice versa.                                                                                                                                                                                                      |
| relative        | relative_rotation | disabled      | When enabled, 0 degrees always points to the center of the image and rotation is relative to that value.                                                                                                                                                                                                         |
| rays Nb         | ray_nb            | 50            | Sets the number of rays emitted.                                                                                                                                                                                                                                                                                 |
| thickness       | ray_thick         | 0.2           | Sets the thickness of the emitted rays in pixels.                                                                                                                                                                                                                                                                |
| random          | random_thick      | disabled      | When enabled, ray thickness is randomized within the range [1,thickness].                                                                                                                                                                                                                                        |
| sparkle falloff | spark_falloff     | 0.05          | When <b>Sparkle type</b> is set to <b>Sparkles</b> , determines whether or not rays are connected to the position indicator. Higher values decrease the distance from the sparkle to the position indicator and vice versa.                                                                                      |
| ray falloff     | ray_falloff       | 2             | Sets how quickly rays falloff as distance from the                                                                                                                                                                                                                                                               |

| Control (UI)                                               | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                             |
|------------------------------------------------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                            |                  |               | position indicator increases.                                                                                                                                                                                                                        |
|                                                            |                  |               |  <b>Note:</b> This control behaves differently depending on the <b>Sparkle type</b> selected. For example, <b>Fireworks</b> falloff towards the position indicator. |
| seed                                                       | seed             | 23            | Sets the random seed that controls ray characteristics. If you're using multiple Sparkle nodes, you can use the same seed to produce similar random results on both nodes.                                                                           |
| Color                                                      |                  |               |                                                                                                                                                                                                                                                      |
| brightness                                                 | brightness       | 1             | Sets ray brightness - higher values increase brightness.                                                                                                                                                                                             |
| color                                                      | color            | 1             | Sets the ray color.                                                                                                                                                                                                                                  |
| chroma shift                                               | chroma_shift     | 0             | Sets the amount of chroma shift applied to the rays. Positive values split red clockwise and blue counter-clockwise and vice versa.                                                                                                                  |
| chroma spread                                              | chroma_spread    | 0             | Sets the spread of chroma values from the position indicator. Positive values extend the spread of the red channel while reducing the blue channel and vice versa.                                                                                   |
| Mask                                                       |                  |               |                                                                                                                                                                                                                                                      |
| mask                                                       | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                        |
|                                                            | vismask          | none          | The channel to use as a mask. By default, the sparkles are limited to the non-black areas of this channel.                                                                                                                                           |
| mask blur                                                  | vismask_size     | 4             | Sets the size of the mask when <b>mask</b> is set to anything other than <b>none</b> .                                                                                                                                                               |
| Effects Tab                                                |                  |               |                                                                                                                                                                                                                                                      |
| Sparkle crawl - These controls do not affect <b>Rays</b> . |                  |               |                                                                                                                                                                                                                                                      |

| Control (UI)            | Knob (Scripting)    | Default Value | Function                                                                                                               |
|-------------------------|---------------------|---------------|------------------------------------------------------------------------------------------------------------------------|
| Sparkle crawl           | sparkle_crawl       | disabled      | When enabled, use the <b>Sparkle crawl</b> controls to cause <b>Sparkles</b> or <b>Fireworks</b> to move, or crawl.    |
| motion                  | motion              | 300           | Sets the amount of motion to apply. Animating this control causes <b>Sparkles</b> or <b>Fireworks</b> to crawl.        |
| direction               | direction           | 0             | Sets the direction of crawl in degrees. Animate this control to produce more crawl.                                    |
| ray fade                | fadeTolerance       | 30            | Controls the amount of fade to apply to <b>Sparkles</b> only.                                                          |
| Broken rays             |                     |               |                                                                                                                        |
| Broken rays             | broken_rays         | disabled      | When enabled, use the <b>Broken rays</b> controls affect the rays emitted from the position indicator.                 |
| % ray affected          | broken_affected     | 50            | Sets the percentage of rays to affect with breaks.                                                                     |
| break start             | broken_start        | 0.7           | Sets where the first break occurs as a percentage of the total length. For example, 0.5 is equal to 50% of the length. |
| random                  | random_broken_start | disabled      | When enabled, the <b>break start</b> control is randomized.                                                            |
| breaks                  | broken_holes        | 0.2           | Sets the number of breaks per ray after the <b>break start</b> .                                                       |
| random                  | random_broken_holes | disabled      | When enabled, the <b>breaks</b> control is randomized.                                                                 |
| Sparks                  |                     |               |                                                                                                                        |
| sparks (direction clip) | sparks              | disabled      | When enabled, use the <b>Sparks</b> controls to clip the emission angle and direction.                                 |
| direction               | sparks_direction    | 0             | Sets the ray's emission direction in degrees.                                                                          |
| open angle              | sparks_angle        | 45            | Sets the angle from which rays can be emitted. For example, 360 causes rays to emit in all directions.                 |

# Text

This node lets you add text overlays on your images. You can simply type in the text you want to have displayed or use Tcl expressions or Tcl variables to create a text overlay. Text overlays can also be animated using animation layers in the **Groups** tab, so that their properties (such as position, size, and color) change over time. These features make the Text node useful, for example, for creating slates or scrolling credits.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to receive the text overlay.                                                                                                                                                                                                                                                                                                                         |
|                 | mask            | <p>An optional image to use as a mask. By default, the text is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as a triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                         |
|--------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Text Tab     |                  |               |                                                                                                                                                                                                  |
| output       | output           | rgba          | <p>The text only appears in these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> |
| premult      | premult          | none          | These channels are multiplied by the drawn text, so that they are set to black outside the text shape.                                                                                           |

Negative values produce anti-clockwise rotation.                                                                                                                                                                                                                                                                                                                 |
| scale                                                                                          | scale            | 1             | Scales the text. Scale width and height are ganged by default.                                                                                                                                                                                                                                                                                                                                |
| skew X                                                                                         | skewX            | 0             | Skews the text on the x axis.                                                                                                                                                                                                                                                                                                                                                                 |
| skew Y                                                                                         | skewY            | 0             | Skews the text on the y axis.                                                                                                                                                                                                                                                                                                                                                                 |
| skew order                                                                                     | skew_order       | XY            | <p>Sets the order in which <b>skew X</b> and <b>skew Y</b> are applied:</p> <ul style="list-style-type: none"> <li>• <b>XY</b> - skew X is applied before skew Y.</li> <li>• <b>YX</b> - skew Y is applied before skew X.</li> </ul>                                                                                                                                                          |
| center xy                                                                                      | center           | N/A           | Sets the center of rotation and scaling. You can also move it using <b>Ctrl/Cmd</b> +drag.                                                                                                                                                                                                                                                                                                    |
| animation layers                                                                               | group_animation  | N/A           | <p>Displays groups created from the text in the <b>message</b> field, allowing you to animate the required characters using the transform controls.</p> <p>Select the required text in the Viewer or <b>message</b> field and then click the <b>+</b> button to create an animation layer. Select the group and apply the required transforms using the controls on the <b>Group</b> tab.</p> |
| Color Tab                                                                                      |                  |               |                                                                                                                                                                                                                                                                                                                                                                                               |
| ramp                                                                                           | ramp             | none          | Select whether to create a color gradient across                                                                                                                                                                                                                                                                                                                                              |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | <p>the text:</p> <ul style="list-style-type: none"> <li>• <b>none</b> - don't create a color gradient.</li> <li>• <b>linear</b> - the ramp changes linearly from one color into another.</li> <li>• <b>smooth0</b> - the ramp color gradually eases into the point 0 end. This means colors in the point 0 end are spread wider than colors in the point 1 end.</li> <li>• <b>smooth1</b> - the ramp color eases into the point 1 end. This means colors in the point 0 and point 1 ends are spread wider than colors in the center of the ramp.</li> </ul> |
| color        | color            | 1             | <p>Sets the color for the text.</p> <p>If <b>ramp</b> is set to anything other than <b>none</b>, this is the color for the ramp at the point 1 end (by default, the top end).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

The following controls are only available if **ramp** is set to anything other than **none**.

|             |                |          |                                                                                                         |
|-------------|----------------|----------|---------------------------------------------------------------------------------------------------------|
| point 1     | p1             | 100, 400 | Sets the position of the point 1 indicator. This allows you to adjust the spread and angle of the ramp. |
| color 0     | color0         | 0        | Sets the color for the ramp at the point 0 end (by default, the bottom end).                            |
| point 0     | p0             | 100, 100 | Sets the position of the point 0 indicator. This allows you to adjust the spread and angle of the ramp. |
| Shadows Tab |                |          |                                                                                                         |
| enable drop | enable_shadows | disabled | When enabled, drop shadows are applied to the                                                           |

| Control (UI)        | Knob (Scripting)           | Default Value | Function                                                                                                                                                                         |
|---------------------|----------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| shadows             |                            |               | text.<br><br>When disabled, all other controls on this tab are also disabled.                                                                                                    |
| inherit input color | shadow_inherit_input_color | disabled      | When enabled, shadows inherit their color from the text's input color.<br><br>When disabled, the color controls are enabled, allowing you to set the shadow color independently. |
| color               | color                      | 0,0,0,1       | Sets the color of the drop shadow when <b>inherit input color</b> is disabled.                                                                                                   |
| opacity             | opacity                    | 0.7           | Sets the opacity of any drop shadow applied to the text, where 0 is totally transparent and 1 is totally opaque.                                                                 |
| angle               | angle                      | 225           | Sets the cast angle for drop shadows relative to the text, in degrees, where 0 is left to right.                                                                                 |
| distance            | distance                   | 5             | Sets the separation distance between the text and the drop shadow.                                                                                                               |
| softness            | softness                   | 0             | Sets the softness, or blur, of any drop shadow applied to the text. Higher values produce greater blur.                                                                          |
| shrink/expand       | shrink/expand              | 0             | Sets the thickness of drop shadows relative to the text. Negative values produce thinner shadows and vice versa.                                                                 |

# Time Nodes

Time nodes deal with distorting time (that is, slowing down, speeding up, or reversing clips), applying motion blur, and performing editorial operations like slips, cuts, splices, and freeze frames.

## Add 3:2 pulldown

Adds 3:2 pulldown to the input footage.

3:2 pulldown is a process of converting 24 frames per second (fps) film to 29.97 fps interlaced video. In this process, the film is first slowed down 0.1% to match the speed difference between 29.97 fps and 30 fps. Then, film frames are distributed across video fields in a repeating 3:2 pattern in order to make 24 film frames fill the space of 30 video frames per second:

- The first frame of film is copied to 3 fields of video,
- the second frame of film is copied to 2 fields of video,
- the third frame of film is again copied to 3 fields,
- the fourth frame of film is copied to 2 fields, and so on.

If you're using footage that was originally film but was converted to video, you may have used the Remove 3:2 pulldown node when importing the footage to Nuke. In this case, the Add 3:2 pulldown node allows you to reintroduce 3:2 pulldown before rendering the footage back to video.

See also [Remove 3:2 pulldown](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                   |
|-----------------|-----------------|--------------------------------------------|
| Input           | 1               | The image sequence to add 3:2 pulldown to. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| phase        | phase            | 0             | <p>The 3:2 pulldown process results in:</p> <ul style="list-style-type: none"> <li>• three whole frames that contain two fields from the same film frame, and</li> <li>• two split-field frames that contain fields from two different film frames. The two split-field frames are always adjacent to each other.</li> </ul> <p>This control lets you shift the point at which the two split-field frames occur within the first five frames of the footage, relative to your first input frame.</p> |

# AppendClip

AppendClip lets you *splice* clips. Splicing refers to joining clips head-to-tail, thus allowing action to flow from one shot to the next. When you splice clips, you have options for:

- Fading to or from black.
- Dissolving between input clips.
- Slipping the combined clip in time.

To make an edit, you can first use the FrameRange node to cut portions out of input sequences and then use the AppendClip node to link them together.

See also [FrameRange](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                  |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------|
| Input           | 1               | The image sequence to which subsequent clips are appended. You can connect any number of sequences to an AppendClip node. |

| Control (UI)                  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                             |
|-------------------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AppendClip Tab                |                  |               |                                                                                                                                                                                                                                                                                                      |
| Fade In                       | fadeIn           | 0             | Sets the number of frames to fade in from black on the first clip in the sequence.                                                                                                                                                                                                                   |
| Fade Out                      | fadeOut          | 0             | Sets the number of frames to fade out to black on the last clip in the sequence.                                                                                                                                                                                                                     |
| Cross Dissolve                | dissolve         | 0             | <p>Sets the number of frames to use to dissolve between clips.</p> <p>Bear in mind that differences in format between dissolved clips are not catered for, so you may want to use <b>Cross Dissolve</b> in conjunction with Reformat nodes.</p>                                                      |
| First Frame                   | firstFrame       | 1             | Sets the amount of frames to slip the start of the first clip in the sequence. For example, a value of 5 causes the first clip to start playing at frame 5 instead of frame 1.                                                                                                                       |
| Last Frame                    | lastFrame        |               | Depending on the <b>First Frame</b> value, displays the frame number of the end of the sequence after the slip.                                                                                                                                                                                      |
| take metadata from first clip | meta_from_first  | disabled      | <p>When disabled, the metadata is taken from whichever input is currently taking precedence.</p> <p>This control was added to preserve the behavior of previous versions of Nuke, where the metadata was always taken from the first input, and is on by default when a legacy script is loaded.</p> |

# FrameBlend

The FrameBlend node interpolates frames by generating an additive composite of the frames that precede and follow it, rather than creating mere copies between the existing frames. This method creates “ghosting” around all fast moving features. The results may look odd when viewed as part of a still frame, but will contribute to smoother motion during actual playback.

You should insert this node before the temporal effect you want to influence (for example, before a Retime node).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to blend.                                                                                                                                                                                                                                                                                                                                                 |
|                 | mask            | <p>An optional image to use as a mask. By default, the frame blend is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                   |
|----------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Frame Range           | startframe       | -1            | When <b>Custom</b> is enabled, the specified frame range is blended together producing the same result for every output frame (unless you put an expression into the frame numbers).                                                                                                                                                                                        |
|                       | endframe         | -1            |                                                                                                                                                                                                                                                                                                                                                                             |
| Custom                | userange         | disabled      | When enabled, use the <b>Frame Range</b> controls to specify the blended frame range.                                                                                                                                                                                                                                                                                       |
| Input Range           | getinputrange    | N/A           | Click to automatically use the input sequence frames as the blend <b>FrameRange</b> .                                                                                                                                                                                                                                                                                       |
| Foreground matte      | N/A              | disabled      | Enables the associated matte channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                              |
|                       | inputmask        | none          | Use this channel as a matte around a moving foreground object so that only pixels with a value of zero are blended. If you blend enough frames together and the object moves enough, the object is removed from the output to produce a clean background plate.                                                                                                             |
| output Image count to | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                               |
|                       | blendmask        | none          | <p>When enabled, saves a floating point alpha image to a channel you specify; the result indicates the number of images that contributed to each pixel of the matte.</p> <p>To normalize the alpha, divide the number 1 by the</p>                                                                                                                                          |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                             |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | number of frames averaged, and then multiply the alpha channel by this result. You can also use the inverse of this matte for additional degraining. |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                        |
|              | maskChannelInput | none          | The channel to use as a mask. By default, the blend is limited to the non-black areas of this channel.                                               |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.         |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel so that the blend is limited to the non-white areas of the mask.                                                 |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.                                                                                         |
|              |                  |               | When disabled, the effect is applied to the entire mask.                                                                                             |
| mix          | mix              | 1             | Mixes between the original image at 0 and the full frame blend at 1.                                                                                 |

# FrameHold

Lets you either:

- pick one frame and use that frame at every frame of the input clip, or
- use every certain number of frames of the input clip (for example, every fifth frame).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | An image sequence with a single frame or every certain number of frames you want to use, disregarding all other frames. |

| Control (UI)         | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                   |
|----------------------|-------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FrameHold Tab        |                   |               |                                                                                                                                                                                                                            |
| first frame          | firstFrame        | 1             | The first frame to use. If <b>increment</b> is set to 0, <b>first frame</b> is used at every frame of the input clip.                                                                                                      |
| Set to Current Frame | setToCurrentFrame | N/A           | Click to set the <b>first frame</b> control to the current Viewer frame.                                                                                                                                                   |
| increment            | increment         | 0             | The increment to use when rendering every certain number of frames from the input clip. For example, if this is set to 5 and <b>first frame</b> is set to 1, Nuke only uses frames 1, 6, 11, 16, and so on from the input. |

## FrameRange

Lets you set a frame range for a clip. This controls which frames are sent to the flipbook and displayed in the Viewer when the frame range source dropdown menu is set to **Input**.

After setting the frame range for a clip, you may want to adjust the script length for the new output range. Press **S** on the Node Graph to open the **Project Settings**, and enter frame range values that match the output range you specified.

To make an edit, you can first use this node to cut portions out of input sequences and then append the results together using the [AppendClip](#) node.

**Tip:** Using FrameRange, you can also set the frame range for a clip directly in the Dope Sheet. See Nuke's [online help](#) for more information.

## Inputs and Controls

| Connection Type | Connection Name | Function                   |
|-----------------|-----------------|----------------------------|
| Input           | unnamed         | The image sequence to cut. |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                   |
|----------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FrameRange Tab |                  |               |                                                                                                                                                                                                                                            |
| frame range    | first_frame      | 1             | Enter the appropriate in and out point values.<br><br>For example, if your original clip is 50 frames but you want to use only the last 25 frames in your composite, you would enter 25 as the first frame and leave the last frame at 50. |
|                | last_frame       | 100           |                                                                                                                                                                                                                                            |
| reset          | N/A              | N/A           | Resets the frame range to its original in and out points.                                                                                                                                                                                  |

## Kronos

Kronos (NukeX and Nuke Studio only) is a retimer, designed to slow down or speed up footage. It works by calculating the motion in the sequence in order to generate motion vectors, which in turn, enables you to generate an output image at any point in time throughout the sequence by interpolating along the direction of the motion. Kronos also contains a number of controls to allow you to trade off render time versus accuracy of vectors.

See also [OFlow](#), [TimeWarp](#), and [Retime](#).

## Inputs and Controls

| Connection Type | Connection Name  | Function                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | FgVecs<br>BgVecs | <p>If the motion in your input sequence has been estimated before (for example, using VectorGenerator), you can supply one or more vector sequences to Kronos to save processing time.</p> <div>  <b>Note:</b> The <b>BgVecs</b> input appears as an arrowhead on the side of the node.         </div> |
|                 | MoSrc            | An alternate Motion Source input, for example, if your <b>Source</b> sequence is very noisy and interfering with the motion estimation.                                                                                                                                                                                                                                                 |
|                 | Matte            | An optional matte of the foreground, which may improve the motion estimation by reducing the dragging of pixels that can occur between foreground and background objects.                                                                                                                                                                                                               |
|                 | Source           | The sequence to retime.                                                                                                                                                                                                                                                                                                                                                                 |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|               |                  |               |  <b>Note:</b> Scripts loaded from previous versions of Nuke default to <b>Local</b> motion estimation for backward compatibility. Adding a new Kronos node to the Node Graph defaults the <b>Method</b> to <b>Regularized</b> motion estimation.                                                                                                                                                                                                                                                                         |
| Vector Detail | vectorDetail     | 0.3           | <p>Adjust this to vary the density of the vector field. A value of 1 generates a vector at each pixel, whereas a value of 0.5 generates a vector at every other pixel.</p> <p>Higher values pick up finer movement, but also increase processing time.</p>                                                                                                                                                                                                                                                                                                                                                |
| Strength      | strength         | 1.5           | <p>This control is only active if <b>Method</b> is set to <b>Regularized</b>.</p> <p>Sets the strength in matching pixels between frames. Higher values allow you to accurately match similar pixels in one image to another, concentrating on detail matching even if the resulting motion field is jagged. Lower values may miss local detail, but are less likely to provide you with the odd spurious vector, producing smoother results.</p>  <b>Note:</b> The default value should work well for most sequences. |
| Smoothness    | smoothness       | 0.5           | <p>This control is only active if <b>Method</b> is set to <b>Local</b>.</p> <p>A high smoothness can miss lots of local detail, but is less likely to provide you with the odd spurious vector, whereas a low smoothness concentrates on detail matching, even if the resulting field is jagged.</p>                                                                                                                                                                                                                                                                                                      |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                  |               |  <b>Note:</b> The default value should work well for most sequences.                                                                                                                                                                                                                                                                                                                                                      |
| Resampling      | resampleType     | Bilinear      | <p>Sets the type of resampling applied when retiming:</p> <ul style="list-style-type: none"> <li>• <b>Bilinear</b> - the default filter. Faster to process, but can produce poor results at higher zoom levels. You can use <b>Bilinear</b> to preview a retime before using one of the other resampling types to produce your output.</li> <li>• <b>Lanczos4</b> and <b>Lanczos6</b> - these filters are good for scaling down, and provide some image sharpening, but take longer to process.</li> </ul> |
| Shutter         |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Shutter Samples | shutterSamples   | 1             | <p>Sets the number of in-between images used to create an output image during the shutter time. Increase this value for smoother motion blur, but note that it takes much longer to render.</p> <div>   </div> <div> <span>Shutter Samples 2</span> <span>Shutter Samples 20</span> </div>                                        |
| Shutter Time    | shutterTime      | 0             | <p>Sets the equivalent shutter time of the retimed sequence. For example, a shutter time of 0.5 is equivalent to a 180 degree mechanical shutter, so at 24 frames per second the exposure time will be 1/48th of a second.</p> <p>Imagine a gray rectangle moving left to right horizontally across the screen. The figures below show how <b>Shutter Time</b> affects the retimed rectangle.</p>                                                                                                          |

| Control (UI)           | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Advanced

|                      |                     |                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------|---------------------|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flicker Compensation | flickerCompensation | disabled                  | <p>When enabled, Kronos takes into account variations in luminance and overall flickering, which can cause problems with your output.</p> <p>Examples of variable luminance include highlights on metal surfaces, like vehicle bodies, or bodies of water within a layer that reflect light in unpredictable ways.</p> <div>  <b>Note:</b> Using <b>Flicker Compensation</b> increases rendering time. </div> |
| Legacy Mode          | legacymodeNuke9     | Dependent on Nuke version | <p>Scripts loaded from previous versions of Nuke default to <b>Legacy Mode</b> for backward compatibility. Adding a new Kronos node to the Node Graph hides this control.</p> <p>When enabled, Kronos reverts to the legacy method for calculating <b>Output Speed</b> using the <b>Local</b> motion estimation method.</p>                                                                                                                                                                      |

## Advanced &gt; Tolerances

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Weight Red      | weightRed        | 0.3           | For efficiency, much of the motion estimation is done on luminance only - that is, using monochrome images. The tolerances allow you to tune the weight of each color channel when calculating the image luminance. These parameters rarely need tuning. However, you may, for example, wish to increase the red weighting <b>Weight Red</b> to allow the algorithm to concentrate on getting the motion of a primarily red object correct, at the cost of the rest of the items in a shot. |
| Weight Green    | weightGreen      | 0.6           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Weight Blue     | weightBlue       | 0.1           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Vector Spacing  | vectorSpacing    | 20            | Sets the spacing between motion vectors displayed on the Viewer when <b>Overlay Vectors</b> is enabled. The default value of 20 means every 20th vector is drawn.                                                                                                                                                                                                                                                                                                                           |
| Overlay Vectors | showVectors      | disabled      | When enabled, the motion vectors are displayed in the Viewer. Forward motion vectors are drawn in red, and backward motion vectors in blue.                                                                                                                                                                                                                                                                                                                                                 |

**Note:** Motion vectors displayed in the Viewer are added to your output if you don't turn off the overlay before rendering.

# NoTimeBlur

NoTimeBlur prevents nodes downstream from asking for fractional or multiple frames. You can use this node to avoid unwanted computation. For example, you may find that using [TimeBlur](#) on all the upstream nodes in your composition can be unnecessary and very time consuming. In these cases, you can use NoTimeBlur node to limit the number of nodes to which you're applying TimeBlur. Just insert the NoTimeBlur node in your node tree above the TimeBlur and any nodes you want the TimeBlur node to process.

You can also use the NoTimeBlur node to force animated objects to align with input images.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                  |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | NoTimeBlur can be inserted between any two existing nodes to limit requests for fractional or multiple frames downstream. |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## OFlow

Lets you generate high-quality retiming operations, such as slowing down or speeding up the input footage. OFlow analyzes the movement of all pixels in the frames, generates motion vectors based on the analysis, and then renders new “in-between” images by interpolating along the direction of the motion. You can also use OFlow to add motion blur or enhance the existing motion blur in the image.

See also [Retime](#) and [Kronos](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                |
|-----------------|-----------------|-------------------------|
| Input           | Source          | The sequence to retime. |

| Control (UI)         | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Channels     | retimedChannels  | all           | Sets the channels affected by the retime.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Method       | method           | Motion        | <p>Sets the interpolation algorithm:</p> <ul style="list-style-type: none"> <li>• <b>Frame</b> - the nearest original frame is displayed.</li> <li>• <b>Blend</b> - a mix between two frames is used for the in-between frame. This is quick to render and is useful when tweaking the timing on a curve before setting the method to motion.</li> <li>• <b>Motion</b> - vector interpolation is used to calculate the in-between frame.</li> </ul>                                                      |

| Control (UI) | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|-------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Timing       | timing2           | Output Speed  | <p>Sets how to control the new timing of the clip:</p> <ul style="list-style-type: none"> <li>• <b>Output/Input Speed</b> - describes the retiming in terms of overall output duration. For example, double speed halves the duration of the clip and half speed doubles the duration of the clip.</li> <li>• <b>Frame</b> - describes the retiming in relative terms, for example, 'at frame 100 in the output clip, display frame 50 of the source clip'. You'll need to set at least 2 key frames for this to retime the clip.</li> </ul>                                                                                                                 |
| Output Speed | timingOutputSpeed | 0.5           | <p>This control is only active if <b>Timing</b> is set to <b>Output Speed</b>.</p> <p>Values below 1 slow down the clip and vice versa. For example, to slow down the clip by a factor of two (half speed), set this value to 0.5.</p> <div>  <p><b>Note:</b> Retimes can be difficult to control using <b>Output Speed</b>, because you're retiming output frames. Altering a keyframe alters the relative position of all later frames. However, <b>Output Speed</b> keyframes do allow you to use negative speed values, unlike <b>Input Speed</b> retimes.</p> </div> |
| Input Speed  | timingInputSpeed  | 0.5           | <p>This control is only active if <b>Timing</b> is set to <b>Input Speed</b>.</p> <p>Values below 1 slow down the clip and vice versa. For example, to slow down the clip by a factor of two (half speed), set this value to 0.5.</p>                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                  |               |  <b>Note:</b> Retimes can be easier to control using <b>Input Speed</b> , because keyframes are set against the source frames, rather than the output frames. However, <b>Input Speed</b> keyframes do not allow you to use negative speed values, unlike <b>Output Speed</b> retimes.                                                                                                        |
| Frame         | timingFrame2     | 1             | <p>This control is active only if <b>Timing</b> is set to <b>Frame</b>.</p> <p>Use this to specify the source frame at the current frame in the timeline. For example, to slow down a 50 frame clip by half, key the <b>Frame</b> to 1 at frame 1 and the <b>Frame</b> to 50 at frame 100.</p>                                                                                                                                                                                 |
| Vector Detail | vectorDetail     | 0.2           | <p>Adjust this to vary the density of the vector field. A value of 1 generates a vector at each pixel, whereas a value of 0.5 generates a vector at every other pixel.</p> <p>Higher values pick up finer movement, but also increase processing time.</p>                                                                                                                                                                                                                     |
| Smoothness    | smoothness       | 0.5           | <p>A high smoothness can miss lots of local detail, but is less likely to provide you with the odd spurious vector, whereas a low smoothness concentrates on detail matching, even if the resulting field is jagged.</p> <div>  <b>Note:</b> The default value should work well for most sequences.         </div>                                                                          |
| Resampling    | resampleType     | Bilinear      | <p>Sets the type of resampling applied when retiming:</p> <ul style="list-style-type: none"> <li>• <b>Bilinear</b> - the default filter. Faster to process, but can produce poor results at higher zoom levels. You can use <b>Bilinear</b> to preview a retime before using one of the other resampling types to produce your output.</li> <li>• <b>Lanczos4</b> and <b>Lanczos6</b> - these filters are good for scaling down, and provide some image sharpening,</li> </ul> |

| Control (UI)           | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Vector Spacing        | vectorSpacing       | 20            | Sets the spacing between motion vectors displayed on the Viewer when <b>Overlay Vectors</b> is enabled. The default value of 20 means every 20th vector is drawn.                                                                                                                                                                                                                                                                                                                                  |
| Overlay Vectors       | showVectors         | disabled      | When enabled, the motion vectors are displayed in the Viewer. Forward motion vectors are drawn in red, and backward motion vectors in blue.                                                                                                                                                                                                                                                                                                                                                        |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                           |
|--------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               |  <b>Note:</b> Motion vectors displayed in the Viewer are added to your output if you don't turn off the overlay before rendering. |

# Remove 3:2 pulldown

Removes 3:2 pulldown from the input footage.

If you're using footage that was originally film but was converted to video, you may want to use the Remove 3:2 pulldown node when importing the footage to Nuke. This allows you to convert the footage to its original state (24 fps non-interlaced film) before adding effects to it. If you later want to render the footage back to video again, you can use the [Add 3:2 pulldown](#) node to reintroduce 3:2 pulldown.

|------------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                        |                  |               | Phase is the point at which the two split-field frames occur within the first five frames of the footage, relative to your first input frame. The value here should match the phase used when 3:2 pulldown was added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| invert field dominance | field_dom        | disabled      | <p>Video frames are usually divided into two fields. Each field contains only half of the image information, drawn as horizontal scan lines:</p> <ul style="list-style-type: none"> <li>• The first field of a frame contains every other scan line.</li> <li>• The second field of a frame contains the remaining scan lines.</li> </ul> <p>When both fields are displayed in rapid sequence, they appear to produce a normal, complete frame.</p> <p><b>Invert field dominance</b> determines which field is displayed first:</p> <ul style="list-style-type: none"> <li>• When enabled, the odd lines come first.</li> <li>• When disabled, the even lines come first.</li> </ul> |

# Retime

Lets you slow down, speed up, or even reverse select frames in a clip without necessarily altering its overall length.

See also [OFlow](#), [TimeWarp](#), and [Kronos](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                |
|-----------------|-----------------|-------------------------|

# SmartVector

The SmartVector node writes motion vectors to the **.exr** format, which are then used to drive the VectorDistort or VectorCornerPin nodes as part of the Smart Vector toolset.

See [VectorDistort](#) and [VectorCornerPin](#).

|----------------------|---------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flicker Compensation | flickerCompensation | disabled      | <p>When enabled, SmartVector takes into account variations in luminance and overall flickering, which can cause problems with your output. Examples of variable luminance include highlights on metal surfaces, like vehicle bodies, or bodies of water within a layer that reflect light in unpredictable ways.</p> <div>  <b>Note:</b> Using <b>Flicker Compensation</b> increases rendering time. </div> |
| Tolerances           |                     |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Weight Red           | weightRed           | 0.3           | <p>For efficiency, much of the motion estimation is done on luminance only - that is, using monochrome images. The tolerances allow you to tune the weight of each color channel when calculating the image luminance. These parameters rarely need tuning. However, you may, for example, wish to increase the <b>Weight Red</b> to allow the algorithm to concentrate on getting the motion of a primarily red object correct, at the cost of the rest of the items in a shot.</p>         |
| Weight Green         | weightGreen         | 0.6           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Weight Blue          | weightBlue          | 0.1           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

# TemporalMedian

This node applies a temporal median filter to the input clip. It outputs each pixel by calculating the median of the current frame, the frame before, and the frame after. This can be useful for removing grain, for example.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to apply a temporal median filter to (typically, the image sequence to degrain).                                                                                                                                                                                                                                                                                            |
|                 | mask            | <p>An optional image to use as a mask. By default, the temporal median filter effect is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)       | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                            |
|--------------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TemporalMedian Tab |                  |               |                                                                                                                                                                                                                                                     |
| channels           | channels         | all           | <p>The temporal median filter effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p>                        |
| core               | core             | 0.05          | If the differences between pixel values on the current, previous, and next frame are greater than this value, those pixels are left unchanged. This is because higher differences between frames probably indicate something other than film grain. |
| mask               | N/A              | disabled      | Enable the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                        |
|                    | maskChannelInput | none          | The channel to use as a mask. By default, the temporal median filter effect is limited to the non-black areas of this channel.                                                                                                                      |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                     |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream. |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel so that the temporal median filter effect is limited to the non-white areas of the mask.                 |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask.                 |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                                          |

# TimeBlur

When a fast moving subject is recorded on film or video, its edges appear to smear as a result of the object's movement while the shutter is open. The longer the shutter remains open at each frame interval, the more obvious this effect. TimeBlur simulates this phenomenon by sampling its input at **divisions** times over **shutter** frames starting at the current frame plus **offset**.

Time blur is commonly applied to garbage masks that are tracked to a fast moving feature. The time blur averages the incoming mask image over the shutter period, to better match the motion blur in the original image and creating a more convincing integration.

See also [NoTimeBlur](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | unnamed         | The image sequence to which you want to apply blur. |

| Control (UI)   | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|---------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TimeBlur Tab   |                     |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| divisions      | divisions           | 10            | The number of times you want to sample the input over the shutter time. For images with fast-moving content, higher values are necessary to eliminate "steppiness" or banding in the output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| shutter        | shutter             | 0.5           | Sets the number of frames the shutter stays open when motion blurring. For example, a value of 0.5 corresponds to half a frame. Increasing the value produces more blur, and decreasing the value less.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| shutter offset | shutteroffset       | start         | <p>Controls how the shutter behaves with respect to the current frame value:</p> <ul style="list-style-type: none"> <li>• <b>centred</b> - center the shutter around the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29,5 to 30,5.</li> <li>• <b>start</b> - open the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 30 to 31.</li> <li>• <b>end</b> - close the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29 to 30.</li> <li>• <b>custom</b> - open the shutter at the time you specify. In the field next to the dropdown menu, enter a value (in frames) you want to add to the current frame. To open the shutter before the current frame, enter a negative value. For example, a value of - 0.5 would open the shutter half a frame before the current frame.</li> </ul> |
|                | shuttercustomoffset | 0             | If the <b>shutter offset</b> control is set to <b>custom</b> , this field is used to set the time that the shutter opens by adding it to the current frame. Values are in frames, so -0.5 would open the shutter half a frame before the current frame.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

# TimeClip

Just like TimeOffset, the TimeClip node lets you move the clip forwards or backwards in time and reverse the order of frames in the clip.

In addition to this basic functionality, you can slip a clip, set the frame range for the clip, set what happens to frames outside of this frame range, fade the clip to or from black, and set expressions to adjust the node's behavior.

**Tip:** Using TimeClip, you can also offset, trim, and slip clips directly in the Dope Sheet. See Nuke's [online help](#) for more information.

See also [TimeOffset](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                    |
|-----------------|-----------------|-----------------------------|
| Input           | unnamed         | The image sequence to slip. |

| Control (UI) | Knob (Scripting) | Default Value                        | Function                                                                                                                                                 |
|--------------|------------------|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| TimeClip Tab |                  |                                      |                                                                                                                                                          |
| Fade In      | fadeIn           | 5                                    | The number of frames to fade from black.                                                                                                                 |
| Fade Out     | fadeOut          | 5                                    | The number of frames to fade to black.                                                                                                                   |
| frame range  | first            | Dependent on <b>Project Settings</b> | The first frame of the range.<br><br>You can also adjust this by going to the <b>Dope Sheet</b> tab and dragging the head of the clip to a new location. |
|              | before           | hold                                 | Sets the behavior of frames before the <b>first</b> frame                                                                                                |

| Control (UI) | Knob (Scripting) | Default Value                        | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|------------------|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |                                      | <p>(examples refer to a 20-frame sequence with a <b>first</b> value of 5):</p> <ul style="list-style-type: none"> <li>• <b>hold</b> - the first frame in the sequence is held until the <b>first</b> frame is reached. Example: 1, 1, 1, 1, 1, 2, 3, 4, etc.</li> <li>• <b>loop</b> - substitutes an equal number of frames, effectively creating a clip loop. Example: 17, 18, 19, 20, 1, 2, 3, 4, etc.</li> <li>• <b>bounce</b> - substitutes a reversed equal number of frames, creating a clip bounce. Example: 5, 4, 3, 2, 1, 2, 3, 4, etc.</li> <li>• <b>black</b> - frames are black until the <b>first</b> frame is reached.</li> </ul>                                                                                                     |
|              | last             | Dependent on <b>Project Settings</b> | <p>The last frame of range.</p> <p>You can also adjust this by going to the <b>Dope Sheet</b> tab and dragging the tail of the clip to a new location.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|              | after            | hold                                 | <p>Sets the behavior of frames after the <b>last</b> frame (examples refer to a 20 frame sequence with a <b>last</b> value of 5):</p> <ul style="list-style-type: none"> <li>• <b>hold</b> - the <b>last</b> frame in the sequence is held until the end of the sequence is reached. Example: 16, 17, 18, 19, 20, 20, 20, 20, etc.</li> <li>• <b>loop</b> - substitutes an equal number of frames, effectively creating a clip loop. Example: 16, 17, 18, 19, 20, 1, 2, 3, 4, etc.</li> <li>• <b>bounce</b> - substitutes a reversed equal number of frames, creating a clip bounce. | frame        | frame_mode       | expression                           | <p>Sets the frame mode:</p> <ul style="list-style-type: none"> <li>• <b>expression</b> - Lets you enter an expression in the field on the right. The expression changes the relation between the current frame and the frame read in. For example, if your clip begins from image.0500.rgb and you want to</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | <p>place this first frame at frame 1 rather than frame 500, you can use the expression <b>frame+499</b>. This way, 499 frames are added to the current frame to get the number of the frame that's read in. At frame 1, image.0500.rgb is read in; at frame 2, image.0501.rgb is read in; and so on. Another example of an expression is <b>frame*2</b>. This expression multiplies the current frame by two to get the number of the frame that's read in. This way, only every other frame in the clip is used. At frame 1, image.0002.rgb is read in; at frame 2, image.0004.rgb is read in; at frame 3, image.0006.rgb is read in; and so on.</p> <ul style="list-style-type: none"> <li>• <b>start at</b> - Lets you enter a start frame number in the field on the right. This specifies the frame where the first frame in the sequence is read in. In other words, all frames are offset so that the clip starts at the specified frame. For example, if your sequence begins from image.0500.rgb and you enter <b>1</b> in the field, image.0500.rgb is read in at frame 1. Similarly, if you enter <b>100</b> in the field, image.0500.rgb is read in at frame 100.</li> <li>• <b>offset</b> - Lets you enter a constant offset in the field on the right. This constant value is added to the current frame to get the number of the frame that's read in. For example, if your clip begins from image.0500.rgb and you want to place this first frame at frame 1 rather than frame 500, you can use <b>499</b> as the constant offset. This way, 499 is added to the current frame to get the frame that's read in. At frame 1, image.0500.rgb is read in; at frame 2, image.0501 is read in, and so on. You can also use negative values as the constant offset. For example, if you use the value <b>-10</b>, Nuke subtracts ten from the current frame to get the frame that's read in. At frame 20, image.0010.rgb is read in; at frame 21, image.0011.rgb is read in; and so on.</li> </ul> |

| original range | origfirst        | Dependent on <b>Project Settings</b> | The original first frame of the sequence.                  |
|                | origlast         | Dependent on <b>Project Settings</b> | The original last frame of the sequence.                   |
| reverse        | reverse          | disabled                             | Reverse the clip within the specified <b>frame range</b> . |

# TimeEcho

Merges multiple frames from the input into a single frame to create an echo-like effect over time. This allows you to create streaking and smearing effects, for example.

## Inputs and Controls

| Connection Type | Connection Name | Function                                     |
|-----------------|-----------------|----------------------------------------------|
| Input           | unnamed         | The image sequence with the frames to merge. |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                 |
|-----------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TimeEcho Tab    |                  |               |                                                                                                                                                                                                                                                                                                                                          |
| TimeEcho Method | mode             | max           | Sets how the frames are blended together: <ul style="list-style-type: none"> <li>• <b>Plus</b> - uses the sum of all frames. Note that this may result in pixel values higher than 1.0.</li> <li>• <b>Max</b> - uses the highest value from the frames.</li> <li>• <b>Average</b> - averages the frames (uses the sum divided</li> </ul> |

| Control (UI)       | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    |                  |               | by the number of frames). The result is darker than the original images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Frames to look at  | framesbehind     | 1             | <p>Sets the number of frames to merge together, counting backwards from the current frame (and including the current frame).</p> <p>For example, if the current frame is 10, and you set this value to 4, TimeEcho merges frames 7, 8, 9, and 10.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Frames to fade out | framesfade       | 1             | <p>Allows you to fade out frames, so that the further back a frame is in time, the less effect it has on the final images. Note that this is the total number of frames over which the fade happens, with the last of these frames remaining at maximum.</p> <p>For example, if you set this to 5, the fade will gradually happen over the first five frames used, with the fifth frame remaining at maximum:</p> <ul style="list-style-type: none"> <li>• the first image is reduced to 20% of its original opacity</li> <li>• the second image is reduced to 40% of its original opacity</li> <li>• the third image is reduced to 60% of its original opacity</li> <li>• the fourth image is reduced to 80% of its original opacity</li> <li>• the fifth image remains at 100% of its original opacity.</li> </ul> |

# TimeOffset

Lets you *offset* a clip. Offsetting a clip refers to moving it backward or forward in time. There are any number of reasons why you might want to do this (for example, to synchronize events in a background and foreground clip).

After offsetting the clip, you may want to adjust the script length for the new output range. Press **S** on the Node Graph to open the **Project Settings**, and enter frame range values that match the output range you specified. If you don't do this, Nuke fills the empty frames at the head or tail of the clip by holding the first or last frame.

**Tip:** Using TimeOffset, you can also offset clips directly in the Dope Sheet. See Nuke's [online help](#) for more information.

## Inputs and Controls

| Connection Type | Connection Name | Function                      |
|-----------------|-----------------|-------------------------------|
| Input           | unnamed         | The image sequence to offset. |

| Control (UI)         | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                    |
|----------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TimeOffset Tab       |                  |               |                                                                                                                                                                                                             |
| time offset (frames) | time_offset      | 0             | <p>The number of frames by which you want to offset the clip.</p> <p>Enter a negative value to subtract frames from the head of the clip. Enter a positive value to add frames to the head of the clip.</p> |
| reverse input        | reverse_input    | disabled      | When enabled, TimeOffset inverts the clip (making the last frame the first, and so on).                                                                                                                     |

## TimeWarp

Lets you slow down, speed up, or even reverse selected frames in a clip without necessarily altering its overall length.

See also [OFlow](#), [Retime](#), and [Kronos](#).

## Inputs and Controls

| Connection Type | Connection Name | Function              |
|-----------------|-----------------|-----------------------|
| Input           | unnamed         | The sequence to warp. |

**Note:** When you connect the TimeWarp node, frame 1 is automatically keyframed as the first frame.

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                   |

# VectorGenerator

VectorGenerator (NukeX and Nuke Studio only) produces images containing motion vector fields. In general, once you have generated a sequence of motion vector fields that describe the motion in a particular clip well, they will be suitable for use in any nodes which can take vector inputs. These include [Kronos](#) and [MotionBlur](#) available in NukeX.

The output from VectorGenerator consists of two sets of motion vectors for each frame. These are stored in the vector channels.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | Matte           | <p>An optional matte of the foreground, which may improve the motion estimation by reducing the dragging of pixels that can occur between foreground and background objects.</p> <p>An optional matte of the foreground. This can be used to help the motion estimation algorithm inside VectorGenerator understand what is foreground and background in the image, so that the dragging of pixels between overlapping objects can be reduced. White areas of the matte are considered to be foreground, and black areas background. Grey areas are used to attenuate between foreground and background.</p> |

| Method        | motionEstimation | Dependent on script | <p>Sets the method of calculating motion estimation vectors:</p> <ul style="list-style-type: none"> <li>• <b>Local</b> - uses local block matching to estimate motion vectors. This method is faster to process, but can lead to artifacts in the output.</li> <li>• <b>Regularized</b> - uses semi-global motion estimation to produce more consistent vectors between regions.</li> </ul> <div>  <p><b>Note:</b> Scripts loaded from previous versions of Nuke default to <b>Local</b> motion estimation for backward compatibility. Adding a new VectorGenerator node to the Node Graph defaults the <b>Method</b> to <b>Regularized</b> motion estimation.</p> </div> |
| Vector Detail | vectorDetail     | 0.3                 | This determines the resolution of the vector field. The larger vector detail is, the greater the processing time, but the more detailed the vectors should be. A value of 1.0 generates a vector at each pixel. A value of 0.5 generates a vector at every other pixel. For some sequences, a high vector detail near 1.0 generates too much unwanted local motion detail, and often a low value is more appropriate.                                                                                                                                                                                                                                                                                                                                      |
| Strength      | strength         | 1.5                 | <p>This control is only active if <b>Method</b> is set to <b>Regularized</b>.</p> <p>Sets the strength in matching pixels between frames. Higher values allow you to accurately</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Weight Red   | weightRed        | 0.3           | For efficiency, much of the motion estimation is done on luminance only - that is, using monochrome images. The tolerances allow you to tune the weight of each color channel when calculating the image luminance. These parameters rarely need tuning. However, you may, for example, wish to increase the red weighting <b>Weight Red</b> to allow the algorithm to concentrate on getting the motion of a primarily red object correct, at the cost of the rest of the items in a shot. |
| Weight Green | weightGreen      | 0.6           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Weight Blue  | weightBlue       | 0.1           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

# VectorToMotion

VectorToMotion converts SmartVectors to **motion**, **forward**, and **backward** channels that can be used with VectorBlur to create motion blur, without using a VectorGenerator.

It doesn't have any controls of its own, it's a conversion tool to convert vectors to motion channels. See Nuke's [online help](#) for more information.

# Channel Nodes

Channel nodes deal with the use of channels and layers within your composite. Typical channels are red, green, blue, and alpha - however, there are many other pieces of useful data that can be stored in unique channels. A layer is simply a collection of channels, for example rgba.

## AddChannels

Adds channels to the input image. Channels that do not already exist are created and filled with the color defined by the **color** knob.

### Inputs and Controls

| Connection Type | Connection Name | Function                                       |
|-----------------|-----------------|------------------------------------------------|
| Input           | unnamed         | The image to which the new channels are added. |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                      |

| color        | color            | 0             | The default color to fill in any new channels - existing channels are not changed.<br><br><div>  <b>Note:</b> The current version only accepts rgba and gray shades for other channels. </div> |

# ChannelMerge

The ChannelMerge node lets you merge together one channel from each input and save the result in the selected **output channel**. All other channels are copied unchanged from the **B** input.

If no **A** input is connected, both channels to merge are taken from the **B** input.

By default, ChannelMerge combines the inputs' alphas.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------|
| Input           | A               | The image that contains a channel to merge with a channel from input <b>B</b> . This input is optional. |

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | B               | The image that contains a channel to merge with a channel from input <b>A</b> . If no <b>A</b> input is connected, both channels to merge are taken from this input.                                                                                                                                                                                                   |
|                 | mask            | <p>An optional image to use as a mask. By default, the merge is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Any data from the <b>B</b> input that's outside this box is clipped.</li> </ul> |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                |
|              | maskChannelInput | none          | The channel to use as a mask. By default, the merge is limited to the non-black areas of this channel.                                                                                                                                                                                                                       |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                 |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel so that the merge is limited to the non-white areas of the mask.                                                                                                                                                                                                                         |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.                                                                                                                                                                                                                                                                 |
|              |                  |               | When disabled, the effect is applied to the entire mask.                                                                                                                                                                                                                                                                     |
| mix          | mix              | 1             | Dissolves between the original B input at 0 and the full merge effect at 1.                                                                                                                                                                                                                                                  |

# Copy

Replaces channels in the **B** input with channels from the **A** input. You can use a mask channel to indicate which input is used for each pixel or whether both inputs should be mixed for some pixels.

Using the **mix** slider, you can use this node as a dissolve. You can also create this node by pressing **K** on the Node Graph.

See also [Shuffle](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | A               | The image that contains a channel to copy to input <b>B</b> .                                                                                                                                                                                                                                                                                                                                                                                                        |
|                 | B               | The image that contains a channel to replace with a channel from the <b>A</b> input.                                                                                                                                                                                                                                                                                                                                                                                 |
|                 | mask            | <p>An optional image to use as a mask. By default, the <b>A</b> input is used where the mask is white, the <b>B</b> input where the mask is black, and a blend between the inputs where the mask is gray.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                 |

| fringe         | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                | unpremult        | none          | The image is divided by this channel before being processed, and multiplied again afterwards.<br><br>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate doing the copy before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one Copy node.<br><br>If you are using unpremultiplied input images, you should leave this set to <b>none</b> . |
| invert         | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| mix            | mix              | 1             | Dissolves between the original B input at 0 and the full copy effect at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

# Remove

Removes channels from the input clip. When you are done using a layer or a channel within a set, you may wish, for the sake of clarity, to remove it so that it is no longer passed to downstream nodes. Note that leaving channels in the stream will not itself cause them to be computed; only channels required are computed.

Removing layers and or channels does not free up space for the creation of new channels and layers. Once you create a channel, it permanently consumes one of the script's 1023 available channel name slots. You are free, however, to rename channels and/or assign them new outputs.

## Inputs and Controls

| Connection Type | Connection Name | Function                                    |
|-----------------|-----------------|---------------------------------------------|
| Input           | unnamed         | The image sequence with channels to remove. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                  |

# Shuffle

**Note:** Nuke 12.1 introduced a new and improved Shuffle2 node, which makes Shuffle and ShuffleCopy obsolete. Shuffle and ShuffleCopy are still available for backward compatibility if you press **X** in the Node Graph and enter **Shuffle** or **ShuffleCopy**.

Shuffle lets you:

- rearrange up to 8 channels from a single image (B input). For example, you can use it to swap rgba.red for rgba.green, and vice versa,
- rearrange channels between two separate nodes (A and B input), like a foreground and background branch,
- replace a channel with black (removing the alpha channel, for example) or with white (making the alpha solid, for example),
- create new channels.

To simply copy a channel from one data stream into another, see [Copy](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                     |
|-----------------|-----------------|--------------------------------------------------------------|
| Input           | B               | The primary image sequence with the channels to rearrange.   |
|                 | A               | The secondary image sequence with the channels to rearrange. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                       |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Shuffle Tab  |                  |               |                                                                                                                                                |
| Input Layer  |                  |               |                                                                                                                                                |
| In           | fromInput1       | B             | The incoming layer(s) that contains the channel(s) to rearrange.                                                                               |
|              | in1              | rgba          | You can also select <b>new</b> here to create new channels.                                                                                    |
| In           | fromInput2       | B             | Additional incoming channels to rearrange. If you only want to rearrange channels from one layer, you don't need these controls.               |
|              | in2              | none          | You can also select <b>new</b> here to create new channels.                                                                                    |

| N/A          | out1             | rgba          | The rearranged channels are output to this layer.                                                                                              |
|              |                  |               | You can also select <b>new</b> here to create new channels.                                                                                    |
| N/A          | out2             | none          | Additional rearranged channels are output to this layer. If you only want to rearrange channels from one layer, you don't need these controls. |
|              |                  |               | You can also select <b>new</b> here to create new channels.                                                                                    |

# ShuffleCopy

**Note:** Nuke 12.1 introduced a new and improved Shuffle2 node, which makes Shuffle and ShuffleCopy obsolete. Shuffle and ShuffleCopy are still available for backward compatibility if you press **X** in the Node Graph and enter **Shuffle** or **ShuffleCopy**.

ShuffleCopy lets you:

- rearrange up to 8 channels from two images (two inputs). For example, you can use it to combine two separate passes (such as the beauty pass and the reflection pass) into the same data stream,
- replace the alpha with black (removing the alpha channel) or with white (making the alpha solid),
- create new channels.

Channels not affected by this node are taken from input 2, which is considered the main data stream.

To rearrange channels in a single upstream node, [Shuffle](#).

To simply copy a channel from one data stream into another, see [Copy](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                         |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------|
| Input           | 1               | The first image sequence with the channels to rearrange.                                                                         |
|                 | 2               | The second image sequence with the channels to rearrange. Any channels not affected by this node are also taken from this input. |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                            |

This allows you to output another four rearranged channels from the node, for a total of eight channels of output to match the possible eight channels of input.</p> <p>You can also select <b>new</b> here to create new channels.</p> |

# Color Nodes

Color nodes deal with color corrections, color space, and color management.

## Add

The Add node lets you *offset* a channel's values. It adds a fixed value to the channel, which, in effect, lightens the whole channel. You can also add a negative value to a channel, in which case the channel gets darker.

### Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                |

|              |                  |               | <p>using one color correct node.</p> <p>If you are using unpremultiplied input images, you should leave this set to <b>none</b>.</p> |
| invert       | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                      |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full offset effect at 1.                                                           |

# Clamp

This node constrains, or clamps, values in the selected channels to a specified range. By default, it clamps all channels to values between 0 and 1. This can be useful for ensuring that the input's blackest blacks and whitest whites will be visible on an intended display device, or for restricting data fed to a subsequent node that does not support numbers outside this range.

See also [ClipTest](#).

By default, the clamp is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Clamp Tab    |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| channels     | channels         | all           | <p>The effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p>                                                                                                                                                                                                                                                                                                        |
| minimum      | minimum          | 0             | <p>The lower clamp value. By default, all values that are lower than this number are set to this value. For example, if you set this to 0.2, any value below 0.2 is set to 0.2. This has the effect of causing black values to go gray.</p> <p>However, if you check <b>enabled</b> next to <b>MinClampTo</b>, all values that are lower than this number are set to the <b>MinClampTo</b> value. For example, if you set this to 0.2 and <b>MinClampTo</b> to 0.4, any value below 0.2 is set to 0.4.</p>   |
|              | minimum_enable   | enabled       | Whether to clamp selected channels to a minimum value. Disabling both <b>minimum</b> and <b>maximum</b> effectively disables the node.                                                                                                                                                                                                                                                                                                                                                                       |
| maximum      | maximum          | 1             | <p>The upper clamp value. By default, all values that are higher than this number are set to this value. For example, if you set this to 0.8, any value above 0.8 is set to 0.8. This has the effect of causing white values to go gray.</p> <p>However, if you check <b>enabled</b> next to <b>MinClampTo</b>, all values that are higher than this number are set to the <b>MaxClampTo</b> value. For example, if you set this to 0.8 and <b>MinClampTo</b> to 0.6, any value above 0.8 is set to 0.6.</p> |
|              | maximum_enable   | enabled       | Whether to clamp selected channels to a maximum value. Disabling both <b>minimum</b> and <b>maximum</b> effectively disables the node.                                                                                                                                                                                                                                                                                                                                                                       |

| Control (UI) | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                    |
|--------------|-------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MinClampTo   | MinClampTo        | 0             | The value to which low illegal values are clamped when <b>MinClampTo</b> is enabled. This sets the clamped areas to a custom color, allowing you to visualize the clamped range or create graphic effects.  |
|              | MinClampTo_enable | disabled      | <p>When enabled, all values below <b>minimum</b> are clamped to the <b>MinClampTo</b> value.</p> <p>When disabled, all values below <b>minimum</b> are clamped to the <b>minimum</b> value.</p>             |
| MaxClampTo   | MaxClampTo        | 1             | The value to which high illegal values are clamped when <b>MaxClampTo</b> is enabled. This sets the clamped areas to a custom color, allowing you to visualize the clamped range or create graphic effects. |
|              | MaxClampTo_enable | disabled      | <p>When enabled, all values above <b>maximum</b> are clamped to the <b>MaxClampTo</b> value.</p> <p>When disabled, all values above <b>maximum</b> are clamped to the <b>maximum</b> value.</p>             |
| mask         | N/A               | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                               |
|              | maskChannelInput  | none          | The channel to use as a mask. By default, the clamp is limited to the non-black areas of this channel.                                                                                                      |
| inject       | inject            | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                |
| invert       | invert_mask       | disabled      | Inverts the use of the mask channel so that the clamp is limited to the non-white areas of the mask.                                                                                                        |
| fringe       | fringe            | disabled      | <p>When enabled, only apply the effect to the edge of the mask.</p> <p>When disabled, the effect is applied to the entire mask.</p>                                                                         |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                | unpremult        | none          | <p>The image is divided by this channel before being processed, and multiplied again afterwards.</p> <p>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate doing the clamp before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.</p> <p>If you are using unpremultiplied input images, you should leave this set to <b>none</b>.</p> |
| invert         | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| mix            | mix              | 1             | Dissolves between the original image at 0 and the full clamp effect at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

# ClipTest

ClipTest applies zebra stripes to all pixels outside a specified range. This can help you ensure that the input's blackest blacks and whitest whites are visible on an intended display device. By default, ClipTest highlights any pixels that are outside the range from 0 to 1.

**Note:** This node affects the final output and not just the Viewer.

See also [Clamp](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence whose out-of-range pixels you want to highlight.                                                                                                                                                                                                                                                                                                             |
|                 | mask            | <p>An optional image to use as a mask. By default, the zebra stripes are limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                     |

| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                | unpremult        | none          | <p>The image is divided by this channel before being processed, and multiplied again afterwards.</p> <p>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate doing the clip test before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.</p> <p>If you are using unpremultiplied input images, you should leave this set to <b>none</b>.</p> |
| invert         | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| mix            | mix              | 1             | Dissolves between the original image at 0 and the full clip test effect at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

# CMSTestPattern

This node generates calibration patterns for color management. You should run the output of this node through a color management node and then render the result with a GenerateLUT node. This way, you can produce 1D and 3D lookup table (LUT) files for various programs:

- **1D LUTs** assume that the primary color channels (red, green, and blue) are independent, and the output for a particular primary color (for example, red) only depends on the input value of that channel (rather than the values of all three channels). For each input value, there is one output value. 1D LUTs are represented by a curve. They are useful for quickly creating an image for viewing purposes, using less processing power, but they cannot be used to adjust saturation independently of brightness.
- In **3D LUTs**, the output values of each primary color channel are calculated based on the input values from all three channels (red, green, and blue). For each input value, there are three output values. This is represented by a 3D grid or cube. 3D LUTs can adjust saturation and brightness together, and are very useful for emulating a particular known look, such as Cineon.

See [GenerateLUT](#) and [Vectorfield](#) for more information.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Output          | unnamed         | <p>Add an arrangement of Nuke nodes that do the color correction you want your 3D LUT to do. Then output the result using a GenerateLUT node.</p> <p>Alternatively, you can insert a Write node after the CMSTestPattern node, write the image out, grade it in another application, and read the result back in using a Read node. Then output the result using a GenerateLUT node.</p> |

| Control (UI)            | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                     |
|-------------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CMSTestPattern Tab      |                  |               |                                                                                                                                                                                                                                                                                                              |
| RGB 3D LUT<br>cube size | cube_size        | 32            | Enter the cube size to use for the test pattern. The cube size defines the size of the LUT cube on the xyz axes with higher values increasing the number of colors. In reality, you would be unlikely to use a cube size greater than 128 and the test pattern is automatically clipped above cube size 444. |

# ColorCorrect

The ColorCorrect node is used to make quick adjustments to contrast, gamma, gain, and offset. You can apply these to a clip's master (entire tonal range), shadows, midtones, or highlights.

You can control the range of the image that is considered to be in the shadows, midtones, and highlights using the lookup curves on the **Ranges** tab. However, do not adjust the midtone curve - midtones are always equal to 1 minus the other two curves.

You can also create this node by pressing **C** on the Node Graph.

See also [Grade](#) and [Multiply](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to receive the color correction.                                                                                                                                                                                                                                                                                                                               |
|                 | mask            | <p>An optional image to use as a mask. By default, the color correction is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                | unpremult        | none          | <p>The image is divided by this channel before being processed, and multiplied again afterwards.</p> <p>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate doing the color correction before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.</p> <p>If you are using unpremultiplied input images, you should leave this set to <b>none</b>.</p> |
| invert         | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| mix luminance  | N/A              | enabled       | Enables the <b>mix luminance</b> slider. Disabling this checkbox is the same as setting <b>mix luminance</b> to 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                | mix_luminance    | 0             | Controls how much of the original luminance is preserved after the color correction. A value of 0 means the altered luminance is used in the output image. A value of 1 produces a luminance value close to that of the original input image.                                                                                                                                                                                                                                                                                                                                                 |
| mix            | mix              | 1             | Dissolves between the original image at 0 and the full color correction at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

# ColorLookup

Allows you to make contrast, gamma, gain, and offset adjustments (and, in fact, many others) using lookup tables (LUTs). LUTs refer to line graphs of a given color channel's brightness. The horizontal axis represents the channel's original, or input, values, and the vertical axis represents the channel's new, or output values.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to color correct.                                                                                                                                                                                                                                                                                                                                              |
|                 | mask            | <p>An optional image to use as a mask. By default, the color correction is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)          | Knob (Scripting) | Default Value | Function                                                                                                                                                  |
|-----------------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| ColorLookup Tab       |                  |               |                                                                                                                                                           |
| channels              | channels         | rgba          | <p>The color correction is only applied to these channels.</p> <p>You can use the checkboxes on the right to select individual channels.</p>              |
| use precomputed table | use_precomputed  | enabled       | When enabled, ColorLookup uses a precomputed lookup table (LUT) between 0 and the value specified in the <b>range</b> field to increase processing speed. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| range        | range            | 1             | Sets the precomputed LUT search range between 0 and this value to increase processing speed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| curve editor | lut              | N/A           | <p>You can use the lookup curves to edit the range of the image in individual channels, or ganged using the <b>master</b> curve (which represents all channels). To edit one curve with reference to another, select multiple curves.</p> <p>You can look up color information for the current pixel in the Viewer. Drag the cursor over the pixels you want to sample for the correction. In the ColorLookup curve editor, press <b>Ctrl/Cmd+Alt</b> while clicking on the curve to set points at the places where the red, green, and blue lines intersect with the color curve. Edit the position of the points and adjust the tangent handles to adjust the curve shape for the color correction.</p> |
| reset        | N/A              | N/A           | Returns the selected curve(s) to the default values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| source       | source           | 0             | Sets a source color for adding points to the curve editor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| target       | target           | 0             | Sets a destination color for adding points to the curve editor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Set RGB      | setRGB           | N/A           | <p>Adds points on the r, g, and b curves, mapping <b>source</b> to <b>target</b>.</p> <p>You can use this control to match shadow, midtone, and highlights on two plates, for example. Set <b>source</b> to shadow rgb in one, <b>target</b> to shadow rgb in the other, then press <b>Set RGB</b>. Same for midtone and highlight areas.</p>                                                                                                                                                                                                                                                                                                                                                             |
| Set RGBA     | setRGBA          | N/A           | Adds points on the r, g, b, and alpha curves, mapping <b>source</b> to <b>target</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Set A        | setA             | N/A           | Adds points on the alpha curve, mapping <b>source</b> to                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |               | <b>target.</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| mask           | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                          |
|                | maskChannelInput | none          | The channel to use as a mask. By default, the color correction is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                                                                                                                                      |
| inject         | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                                                                                                                                           |
| invert         | invert_mask      | disabled      | Inverts the use of the mask channel so that the color correction is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                                                                                        |
| fringe         | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask.                                                                                                                                                                                                                                                                                                                                                           |
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                               |
|                | unpremult        | none          | The image is divided by this channel before being processed, and multiplied again afterwards.<br><br>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate doing the color correction before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                  |
|--------------|------------------|---------------|-------------------------------------------------------------------------------------------|
|              |                  |               | If you are using unpremultiplied input images, you should leave this set to <b>none</b> . |
| invert       | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                           |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full color correction at 1.             |

# ColorMatrix

ColorMatrix multiplies the rgb colors by an arbitrary 3x3 matrix. This is useful for transforming color spaces.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to receive the color correction.                                                                                                                                                                                                                                                                                                                               |
|                 | mask            | <p>An optional image to use as a mask. By default, the color correction is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| ColorMatrix Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| channels        | channels         | rgb           | <p>The color correction is only applied to these channels.</p> <p>You can use the checkboxes on the right to select individual channels.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| matrix          | matrix           | 0             | <p>The color matrix to apply to the input image. The output values of each primary color channel are calculated based on the input values from all three channels (red, green, and blue).</p>  <p>For example, if you enter <b>0.5</b>, <b>1</b>, and <b>2</b> on the first row of the matrix, the input red value is multiplied by 0.5, the input green value by 1, and the input blue value by 2. These are then added together to produce the output red value. The output green and blue values are not affected by the first row of the matrix.</p> <p>You can get the values for the matrix from the <a href="#">Colorspace</a> node's <b>color matrix output</b> control, for example. <b>Ctrl/Cmd</b> + drag the Animation menu to copy the whole matrix at once.</p> |
| invert          | invert           | disabled      | When enabled, the inverse of the matrix is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| mask            | N/A              | 0             | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | maskChannelInput | none          | The channel to use as a mask. By default, the color correction is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| inject         | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| invert         | invert_mask      | disabled      | Inverts the use of the mask channel, so that the color correction is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| fringe         | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                | unpremult        | none          | The image is divided by this channel before being processed, and multiplied again afterwards.<br><br>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate doing the color correction before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.<br><br>If you are using unpremultiplied input images, you should leave this set to <b>none</b> . |
| invert         | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| mix            | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

# Colorspace

The Colorspace node converts images from one colorspace to another, for example from Nuke's native colorspace to other color spaces more appropriate to a given process or intended display device. This node supports RGB, HSV, YUV, CIE, and CMS formats (and various subformats). It can adjust for different primaries, white point, and different encodings.

If you wish to reverse your colorspace conversion later in the script:

1. Copy the Colorspace node and insert it at the appropriate point in your script.
2. Set the **output** controls to **sRGB**, **D55**, and **RGB**.
3. Set the **input** controls to match the values you entered in the first Colorspace node.

If you wish to write out the input clip in the new colorspace, set the **output transform** dropdown menu to **linear** in the Write node controls. This halts the automatic conversion and lets the one you created have priority.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to receive the colorspace conversion.                                                                                                                                                                                                                                                                                                                               |
|                 | mask            | <p>An optional image to use as a mask. By default, the colorspace conversion is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)   | Knob (Scripting) | Default Value | Function |
|----------------|------------------|---------------|----------|
| Colorspace Tab |                  |               |          |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| channels     | channels         | rgb           | <p>The colorspace correction is applied only to these channels.</p> <p>You can use the checkboxes on the right to select individual channels</p>                                                                                                                                                                                                                                        |
| input        | colorspace_in    | linear        | <p>Sets the input colorspace. This node converts the input image from this colorspace to the <b>output</b> colorspace.</p> <div>  <b>Note:</b> The control label has been updated, but the knob name currently remains the same. The knob name will also change in a future release. </div>            |
|              | illuminant_in    | D65           | <p>Sets the input illuminant to simulate colors under different lighting. For example, the default <b>D65</b> simulates illumination roughly equivalent to mid-day sun in Western or Northern Europe.</p>                                                                                                                                                                               |
|              | primary_in       | sRGB          | <p>Sets the input primaries (the exact "shade" of red, green, and blue).</p>                                                                                                                                                                                                                                                                                                            |
| output       | colorspace_out   | linear        | <p>Sets the required output colorspace. This node converts the input image from the <b>input</b> colorspace to this colorspace.</p> <div>  <b>Note:</b> The control label has been updated, but the knob name currently remains the same. The knob name will also change in a future release. </div> |
|              | illuminant_out   | D65           | <p>Sets the output illuminant to simulate colors under different lighting. For example, <b>A</b> simulates illumination from a household tungsten filament light bulb.</p>                                                                                                                                                                                                              |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     | primary_out      | sRGB          | Sets the input primaries (the exact "shade" of red, green, and blue).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| swap input/output   | swap             | n/a           | Swaps the selected <b>input</b> and <b>output</b> colorspace knobs. This can be useful if you're doing certain comp tasks that work better in certain colorspace, such as grading. For example, you might go from <b>ACEScc</b> (input) to <b>scene_linear</b> (output) in a Colorspace node, perform a Grade node adjustment, copy the first Colorspace node after the Grade node, and click the <b>swap input/output</b> button to go back to <b>ACEScc</b> .                                                                                                  |
| Bradford matrix     | bradford_matrix  | disabled      | <p>If the <b>illuminant_in</b> and <b>illuminant_out</b> values are not the same, you can enable this to apply an illuminant adaptation transform. This alters colors so they <i>appear</i> the same.</p> <p>When disabled, the input and output colors have the same CIE colorspace XYZ values.</p>                                                                                                                                                                                                                                                             |
| color matrix output | colormatrix      | N/A           | <p>If a matrix is used in the color transform chosen above, the output appears here.</p> <p>Changing the matrix values has no effect, but you can copy them into a ColorMatrix node to apply them to an image. <b>Ctrl/Cmd</b> + drag the Animation menu to copy the whole matrix at once. See <a href="#">ColorMatrix</a> for more information.</p> <div>  <p><b>Note:</b> A colorspace conversion may be doing far more than just a single 3x3 matrix operation!</p> </div> |
| mask                | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | maskChannelInput | none          | The channel to use as a mask. By default, the colorspace conversion is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| inject         | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| invert         | invert_mask      | disabled      | Inverts the use of the mask channel so that the colorspace conversion is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| fringe         | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                | unpremult        | none          | The image is divided by this channel before being processed, and multiplied again afterwards.<br><br>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate doing the color conversion before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.<br><br>If you are using unpremultiplied input images, you should leave this set to <b>none</b> . |
| invert         | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| mix            | mix              | 1             | Dissolves between the original image at 0 and the full colorspace conversion at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

# ColorTransfer

ColorTransfer lets you match the colors of one clip with those of another. It changes the colors in input **B** to match input **A**.

See also [Grade](#) and [MatchGrade](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | A               | The image sequence whose colors you want to match.  |
|                 | B               | The image sequence whose colors you want to change. |

| Control (UI)                      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ColorTransfer Tab                 |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| ROI x, y, r, t<br>(or x, y, w, h) | ROI              | N/A           | <p>The region of interest. This is the area in input <b>A</b> with the colors to match. By default, it is set to cover the entire input.</p> <p>You can adjust the following:</p> <ul style="list-style-type: none"> <li>• <b>x</b> - the distance (in pixels) between the left edge of image <b>A</b> and the left side of the ROI.</li> <li>• <b>y</b> - the distance (in pixels) between the bottom edge of image <b>A</b> and the bottom edge of the ROI.</li> <li>• <b>r</b> - the distance (in pixels) between the left edge of image <b>A</b> and the right side of the ROI.</li> <li>• <b>t</b> - the distance (in pixels) between the bottom edge of image <b>A</b> and the top edge of the ROI.</li> <li>• <b>w</b> - the width of the ROI. This is only available if you click the <b>wh</b> button.</li> </ul> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | <ul style="list-style-type: none"> <li>• <b>h</b> - the height of the ROI. This is only available if you click the <b>wh</b> button.</li> </ul> <p>You can also adjust the ROI in the Viewer by dragging its edges.</p> <p>When adjusting the ROI, you may want to connect the Viewer to input <b>A</b> rather than the ColorTransfer node, so you can better see the area you are selecting.</p> |

# Crosstalk

Adds or removes crosstalk, or bleeding, from one color channel to another. Each output color channel is the sum of three lookup tables, each indexed by one of the input color channels. The horizontal axis represents the channel's original, or input, values, and the vertical axis represents the channel's new, or output values.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image whose color you want to adjust.                                                                                                                                                                                                                                                                                                                                 |
|                 | mask            | <p>An optional image to use as a mask. By default, the effects are limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)       | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                |

| inject         | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| invert         | invert_mask      | disabled      | Inverts the use of the mask channel so that the effects are limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| fringe         | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|                | unpremult        | none          | The image is divided by this channel before being processed, and multiplied again afterwards.<br><br>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate applying the expressions before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.<br><br>If you are using unpremultiplied input images, you should leave this set to <b>none</b> . |
| invert         | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| mix            | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

# Exposure

Allows you to adjust the exposure of the input sequence using f-stops, printer lights, film densities, or Cineon values.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image whose exposure you want to adjust.                                                                                                                                                                                                                                                                                                                              |
|                 | mask            | <p>An optional image to use as a mask. By default, the effects are limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                               |

| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                | unpremult        | none          | <p>The image is divided by this channel before being processed, and multiplied again afterwards.</p> <p>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate applying the expressions before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.</p> <p>If you are using unpremultiplied input images, you should leave this set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                            |
|--------------|------------------|---------------|---------------------------------------------------------------------|
| invert       | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                     |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1. |

# Expression

Allows you to apply complex mathematical formulas to a channel's values using C-like syntax expressions. If necessary, you can apply different expressions to different sets of channels.

- **x** or **y** is the pixel coordinate. If the input is a proxy image, then these are scaled and translated to the coordinate that would be in the full size image.
- **cx** and **cy** can provide a more useful coordinate system. In this system 0,0 is the center of the picture.  
-1,0 is the center of the left edge, 1,0, is the center of the right edge. 1,1 is a point 45 degrees up from the origin on the right edge (outside the top of the picture if the aspect ratio is greater than 1).
- You can refer to any input channel by name, for example **r** for the red channel.
- You can refer to any control on any node by its name. For example, **Blur1.size** returns the size of the blur. You can also evaluate animated controls, for example **Blur1.size(t)**.
- A blank expression is the same as zero.
- All math is done with 32-bit floating point numbers.

See also [MergeExpression](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to which you want to apply expressions.                                                                                                                                                                                                                                                                                                                    |
|                 | mask            | <p>An optional image to use as a mask. By default, the expressions are limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

|              | maskChannelInput | none          | <p>The channel to use as a mask. By default, the expressions are limited to the non-black areas of this channel.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| inject         | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| invert         | invert_mask      | disabled      | Inverts the use of the mask channel so that the expressions are limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| fringe         | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|                | unpremult        | none          | The image is divided by this channel before being processed, and multiplied again afterwards.<br><br>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate applying the expressions before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.<br><br>If you are using unpremultiplied input images, you should leave this set to <b>none</b> . |
| invert         | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| mix            | mix              | 1             | Dissolves between the original image at 0 and the full expressions effect at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

The following functions are supported:

| Function            | Purpose                                                                                                                      | Operator Usage                                                     | Related Functions                                 |
|---------------------|------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|---------------------------------------------------|
| abs (x)             | Returns the absolute value of a floating-point number x.                                                                     | x                                                                  | See also: fabs.                                   |
| acos (x)            | Calculates the arc cosine of x; that is the value whose cosine is x.                                                         | If x is less than -1 or greater 1, acos returns nan (not a number) | See also: cos, cosh, asin, atan.                  |
| asin (x)            | Calculates the arc sine of x; that is the value whose sine is x.                                                             | If x is less than -1 or greater 1, asin returns nan (not a number) | See also: sin, sinh, acos, atan.                  |
| atan (x)            | Calculates the arc tangent of x; that is the value whose tangent is x. The return value will be between -PI/2 and PI/2.      | x                                                                  | See also: tan, tanh, acos, asin, atan2.           |
| atan2 (x, y)        | Calculates the arc tangent of the two variables x and y. This function is useful to calculate the angle between two vectors. | x, y                                                               | See also: sin, cos, tan, asin, acos, atan, hypot. |
| ceil (x)            | Round x up to the nearest integer.                                                                                           | x                                                                  | See also: floor, trunc, rint.                     |
| clamp (x, min, max) | Return x clamped to the min and max values specified.                                                                        | x, min, max                                                        | See also: min, max.                               |
| clamp (x)           | Return x clamped to [0.0 ... 1.0].                                                                                           | x                                                                  | See also: min, max.                               |
| cos (x)             | Returns the cosine of x.                                                                                                     | x in radians                                                       | See also: acos, sin, tan, cosh.                   |
| cosh (x)            | Returns the hyperbolic cosine of x, which is defined mathematically as:<br>$(\exp(x) + \exp(-x)) / 2$ .                      | x                                                                  | See also: cos, acos, sinh, tanh.                  |
| degrees (x)         | Convert the angle x from radians into degrees.                                                                               | x                                                                  | See also: radians.                                |
| exp (x)             | Returns the value of e (the base of natural logarithms) raised to the power of x.                                            | x                                                                  | See also: log, log10.                             |

| Function                                 | Purpose                                                                                                                                                                                                                                                               | Operator Usage                     | Related Functions                          |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|--------------------------------------------|
| exponent (x)                             | Exponent of x.                                                                                                                                                                                                                                                        | x                                  | See also: mantissa, ldexp.                 |
| fBm (x, y, z, octaves, lacunarity, gain) | Fractional Brownian Motion. This is the sum of octave calls to noise (). The input point for each is multiplied by pow(lacunarity,i) and the result is multiplied by pow(gain,i). For normal use, lacunarity should be greater than 1 and gain should be less than 1. | x, y, z, octaves, lacunarity, gain | See also: noise, random, turbulence.       |
| fabs (x)                                 | Returns the absolute value of the floating-point number x.                                                                                                                                                                                                            | x                                  | See also: abs.                             |
| false ()                                 | Always returns 0.                                                                                                                                                                                                                                                     | none                               | See also: true.                            |
| floor (x)                                | Round x down to the nearest integer.                                                                                                                                                                                                                                  | x                                  | See also: ceil, trunc, rint.               |
| fmod (x, y)                              | Computes the remainder of dividing x by y. The return value is $x - n y$ , where n is the quotient of $x / y$ , rounded towards zero to an integer.                                                                                                                   | x, y                               | See also: ceil, floor.                     |
| frame ()                                 | Return the current frame number.                                                                                                                                                                                                                                      | none                               | See also: x.                               |
| from_byte (color component)              | Converts an sRGB pixel value to a linear value.                                                                                                                                                                                                                       | color_component                    | See also: to_sRGB, to_rec709, from_rec709. |
| from_rec709 (color component)            | Converts a rec709 byte value to a linear brightness.                                                                                                                                                                                                                  | color_component                    | See also: from_sRGB, to_rec709.            |
| from_sRGB (color component)              | Converts an sRGB pixel value to a linear value.                                                                                                                                                                                                                       | color_component                    | See also: to_sRGB, to_rec709, from_rec709. |
| hypot (x, y)                             | Returns the $\sqrt{x^2 + y^2}$ . This is the length of the hypotenuse of a right-angle triangle with sides of                                                                                                                                                         | x, y                               | See also: atan2.                           |

| Function         | Purpose                                                                                                                                                                                                                                                         | Operator Usage            | Related Functions                   |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|-------------------------------------|
|                  | length x and y.                                                                                                                                                                                                                                                 |                           |                                     |
| int (x)          | Round x to the nearest integer not larger in absolute value.                                                                                                                                                                                                    | x                         | See also: ceil, floor, trunc, rint. |
| ldexp (x, exp)   | Returns the result of multiplying the floating-point number x by 2 raised to the power exp.                                                                                                                                                                     | x, exp                    | See also: exponent.                 |
| lerp (a, b, x)   | Returns a point on the line f(x) where f(0)=a and f(1)=b.<br><br>Matches the lerp function in other shading languages.                                                                                                                                          | a, b, x                   | See also: step, smoothstep.         |
| log (x)          | Returns the natural logarithm of x.                                                                                                                                                                                                                             | x                         | See also: log10, exp.               |
| log10 (x)        | Returns the base-10 logarithm of x.                                                                                                                                                                                                                             | x                         | See also: log, exp.                 |
| logb (x)         | Same as exponent().                                                                                                                                                                                                                                             | x                         | See also: mantissa, exponent.       |
| mantissa (x)     | Returns the normalized fraction. If the argument x is not zero, the normalized fraction is x times a power of two, and is always in the range 1/2 (inclusive) to 1 (exclusive). If x is zero, then the normalized fraction is zero and exponent() returns zero. | x                         | See also: exponent                  |
| max (x, y, ... ) | Return the greatest of all values.                                                                                                                                                                                                                              | x, y, (...)               | See also: min, clamp.               |
| min (x, y, ... ) | Return the smallest of all values.                                                                                                                                                                                                                              | x, y, (...)               | See also: max, clamp                |
| mix (a, b, x)    | Same as lerp().                                                                                                                                                                                                                                                 | a, b, x                   | See also: step, smoothstep, lerp    |
| noise (x, y, z)  | Creates a 3D Perlin noise value - a signed range centered on zero. The absolute maximum range is from -1.0 to 1.0.                                                                                                                                              | x, optional y, optional z | See also: random, fBm, turbulence   |

| Function             | Purpose                                                                                                                                                                                            | Operator Usage                     | Related Functions                 |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|-----------------------------------|
|                      | This produces zero at all integers, so you should rotate the coordinates somewhat (add a fraction of y and z to x, etc.) if you want to use this for random number generation.                     |                                    |                                   |
| pi ()                | Returns the value for pi (3.141592654...).                                                                                                                                                         | none                               | none                              |
| pow (x, y)           | Returns the value of x raised to the power of y.                                                                                                                                                   | x, y                               | See also: log, exp, pow           |
| pow2 (x)             | Returns the value of x raised to the power of 2.                                                                                                                                                   | x, y                               | See also: pow                     |
| radians (x)          | Convert the angle x from degrees into radians.                                                                                                                                                     | x                                  | See also: degrees                 |
| random (x, y, z)     | Creates a pseudo random value between 0 and 1 - it always generates the same value for the same x, y and z.<br><br>Calling random with no arguments creates a different value on every invocation. | optional x, optional y, optional z | See also: noise, fBm, turbulence  |
| rint (x)             | Round x to the nearest integer.                                                                                                                                                                    | x                                  | See also: ceil, floor, int, trunc |
| sin (x)              | Returns the sine of x.                                                                                                                                                                             | x in radians                       | See also: asin, cos, tan, sinh    |
| sinh (x)             | Returns the hyperbolic sine of x, which is defined mathematically as:<br>$(\exp(x) - \exp(-x)) / 2$ .                                                                                              | x                                  | See also: sin, asin, cosh, tanh   |
| smoothstep (a, b, x) | Returns 0 if x is less than a, returns 1 if x is greater or equal to b, returns a smooth cubic interpolation otherwise.                                                                            | a, b, x                            | See also: step, lerp              |

| Function                    | Purpose                                                                                                                                                         | Operator Usage  | Related Functions                           |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|---------------------------------------------|
|                             | Matches the smoothstep function in other shading languages.                                                                                                     |                 |                                             |
| sqrt (x)                    | Returns the non-negative square root of x.                                                                                                                      | x               | See also: pow, pow2                         |
| step (a, x)                 | Returns 0 if x is less than a, returns 1 otherwise.<br><br>Matches the step function other shading languages.                                                   | a, x            | See also: smoothstep, lerp                  |
| tan (x)                     | Returns the tangent of x.                                                                                                                                       | x in radians    | See also: atan, cos, sin, tanh, atan2       |
| tanh (x)                    | Returns the hyperbolic tangent of x, which is defined mathematically as:<br>$\sinh(x) / \cosh(x)$ .                                                             | x               | See also: tan, atan, sinh, cosh             |
| to_byte (color component)   | Converts a floating point pixel value to an 8-bit value that represents that number in sRGB space.                                                              | color_component | See also: from_sRGB, to_rec709, from_rec709 |
| to_rec709 (color component) | Converts a floating point pixel value to an 8-bit value that represents that brightness in the rec709 standard when that standard is mapped to the 0-255 range. | color_component | See also: from_sRGB, from_rec709            |
| to_sRGB (color component)   | Converts a floating point pixel value to an 8-bit value that represents that number in sRGB space.                                                              | color_component | See also: from_sRGB, to_rec709, from_rec709 |
| true ()                     | Always Returns 1.                                                                                                                                               | none            | See also: false                             |
| trunc (x)                   | Round x to the nearest integer                                                                                                                                  | x               | See also: ceil, floor, int, rint            |

| Function                                        | Purpose                                                                              | Operator Usage                             | Related Functions            |
|-------------------------------------------------|--------------------------------------------------------------------------------------|--------------------------------------------|------------------------------|
|                                                 | not larger in absolute value.                                                        |                                            |                              |
| turbulence (x, y, z, octaves, lacunarity, gain) | This is the same as fBm() except the absolute value of the noise() function is used. | x, y, z, octaves, lacunarity, gain         | See also: fBm, noise, random |
| x ()                                            | Return the current frame number.                                                     | none                                       | See also: frame              |
| y (frame)                                       | Evaluates the y value for an animation at the given frame.                           | optional: frame, defaults to current frame | none                         |

# Gamma

Applies a constant gamma value to a set of channels. This lightens or darkens the midtones.

The actual function is **1/pow(value)**.

**Note:** Increasing the gamma to lighten the midtones darkens any values above 1. Similarly, decreasing the gamma to darken the midtones lightens any values below 0. If you don't want this to happen, you can instead use a [Colorspace](#) node, which allows you to adjust the gamma using a color curve rather than a slider. Simply add points on the curve just below 0 and above 1 to preserve the super blacks and whites.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to which you want to apply a gamma value.                                                                                                                                                                                                                                                                                                                      |
|                 | mask            | <p>An optional image to use as a mask. By default, the gamma adjustment is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                    |
|--------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Gamma Tab    |                  |               |                                                                                                                                                                                                                                                             |
| channels     | channels         | all           | <p>The gamma adjustment is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p>                                             |
| value        | value            | 1             | <p>The gamma value. The default value of 1 equals no change.</p> <p>Note that you can enter formulae into this field, making it easy to do quick calculations. For example, you could type <b>1/2.2</b> here and press <b>Return</b> to get 0.45454545.</p> |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                               |
|              | maskChannelInput | none          | The channel to use as a mask. By default, the gamma adjustment is limited to the non-black areas of this                                                                                                                                                    |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |               | channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| inject         | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| invert         | invert_mask      | disabled      | Inverts the use of the mask channel so that the gamma adjustment is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| fringe         | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                | unpremult        | none          | The image is divided by this channel before being processed, and multiplied again afterwards.<br><br>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate doing the gamma adjustment before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.<br><br>If you are using unpremultiplied input images, you should leave this set to <b>none</b> . |
| invert         | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| mix            | mix              | 1             | Dissolves between the original image at 0 and the full gamma adjustment at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

# GenerateLUT

Generates lookup tables, or LUTs, from color management nodes downstream of a CMSTestPattern node. LUTs are generated according to the size of CMSTestPattern cube size.

You can use the GenerateLUT node to create both 1D and 3D LUTs:

- **1D LUTs** assume that the primary color channels (red, green, and blue) are independent, and the output for a particular primary color (for example, red) only depends on the input value of that channel (rather than the values of all three channels). For each input value, there is one output value. 1D LUTs are represented by a curve. They are useful for quickly creating an image for viewing purposes, using less processing power, but they cannot be used to adjust saturation independently of brightness.
- In **3D LUTs**, the output values of each primary color channel are calculated based on the input values from all three channels (red, green, and blue). For each input value, there are three output values. This is represented by a 3D grid or cube. 3D LUTs can adjust saturation and brightness together, and are very useful for emulating a particular known look, such as Cineon.

**Tip:** For good visual fidelity when using 3D LUTs, it is recommended that a log colorspace is used for 3D LUT generation. For more information on how to generate a LUT in log colorspace, please refer to Nuke's [online help](#).

For more information, see [CMSTestPattern](#) and [Vectorfield](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                            |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | An arrangement of nodes that do the color correction you want your 3D LUT to do, preceded by a CMSTestPattern node. |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                           |
|-----------------|------------------|---------------|----------------------------------------------------|
| GenerateLUT Tab |                  |               |                                                    |
| output file     | file             | none          | The path and file name of the LUT file you want to |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|              |                  |               | generate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| file type    | file_type        | none          | <p>The file format of the LUT file you want to generate. If this is set to <b>auto</b> (the default), Nuke guesses the format from the file name extension.</p> <p>The following file extensions are recognized:</p> <ul style="list-style-type: none"> <li>• <b>.3dl</b> - Autodesk and ASSIMILATE Scratch LUT format (3D).</li> <li>• <b>.blut</b> - Side Effects Houdini binary LUT format (3D).</li> <li>• <b>.cms</b> - Light Illusion LightSpace CMS LUT format (1D and 3D).</li> <li>• <b>.csp</b> - Rising Sun Research CineSpace LUT format (3D).</li> <li>• <b>.cub</b> - FilmLight Truelight LUT format (1D and 3D).</li> <li>• <b>.cube</b> - IRIDAS LUT format (1D and 3D).</li> <li>• <b>.vf</b> - Nuke's native LUT format used by the Vectorfield node (3D).</li> </ul> |

**Note:** FilmLight and Foundry have elected to no longer bundle Truelight as of Nuke 11. The Truelight node has been superseded by the free version of Baselight for Nuke which itself can import a BLG (Basilight Linked Grade) that can contain a Truelight strip, plus optionally a lot more in terms of creative grading intent. Together with OpenColorIO and the native Nuke Vectorfield node we feel all the Nuke color management issues for which the Truelight node was originally intended are now addressed.

For further information on Baselight for Nuke, please contact [plugin-support@filmlight.ltd.uk](mailto:plugin-support@filmlight.ltd.uk)

|                                                                                                   | style1d            | logarithmic          | Some systems assume the LUT is designed to apply to <b>logarithmic</b> images, others <b>linear</b> . Some LUT formats are assumed to encode values as either logarithmic or linear. Use this setting to get your output LUT values encoded the way your use of the LUT requires.                                                                                                                                                                                                                                                                                                      |
| 3D LUT (These controls are only visible when you've selected 3dl in the file type dropdown menu.) |                    |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| input bit depth (.3dl)                                                                            | bitdepth_id        | 10 bit               | The bit depth to scale input values to for .3dl files. For example, a 10-bit file has values between 0 and 1023.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| output bit depth (.3dl)                                                                           | output_bitdepth_id | input bit depth      | The bit depth to scale output values to for .3dl files. For instance a 10-bit file has values between 0 and 1023. In general this should match the input bit depth.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| clamp output                                                                                      | clamp_output       | enabled              | Clamp 3D LUT output values to the range of 0-1. Turning this off allows superwhite values to be represented which are allowed in some packages, such as Nuke. This may cause the result to be unreadable in other packages.                                                                                                                                                                                                                                                                                                                                                            |
| 3dl file format                                                                                   | format_3dl_id      | autodesk flame/smoke | <p>Select the format you want to use for your .3dl file. The final cube size is determined by the CMSTestPattern which generates the input.</p> <ul style="list-style-type: none"> <li>• <b>autodesk flame/smoke</b> - use Autodesk preferred cube sizes of 17x17, 33x33, and 65x65.</li> <li>• <b>autodesk lustre</b> - use Autodesk preferred cube sizes of 17x17, 33x33, and 65x65, and output a 3DMESH/Mesh header.</li> <li>• <b>assimilate scratch</b> - scale and offset the 3D LUT. This should be used only for legacy scratch files prior to Flame compatibility.</li> </ul> |
| Generate and Write LUT                                                                            | generate           | N/A                  | Generate the LUT file and save it to the <b>output file</b> location.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Python Tab (These controls are for Python callbacks and can be used to have Python functions automatically called when various events happen in Nuke.) |                   |               |                                                                                                                                                      |
| before render                                                                                                                                          | beforeRender      | none          | These functions run prior to starting rendering in execute(). If they throw an exception, the render aborts.                                         |
| before each frame                                                                                                                                      | beforeFrameRender | none          | These functions run prior to starting rendering of each individual frame. If they throw an exception, the render aborts.                             |
| after each frame                                                                                                                                       | afterFrameRender  | none          | These functions run after each frame is finished rendering. They are not called if the render aborts. If they throw an exception, the render aborts. |
| after render                                                                                                                                           | afterRender       | none          | These functions run after rendering of all frames is finished. If they throw an error, the render aborts.                                            |
| render progress                                                                                                                                        | renderProgress    | none          | These functions run during rendering to determine progress or failure.                                                                               |

# Grade

Lets you define white and black points by sampling pixels from the Viewer. Setting the brightest parts of the image to pure white and the darkest to pure black in this manner can help you add punch to overexposed images, for example. You can also use this node for matching foreground plates to background plates.

To sample pixels from the Viewer, click on a color swatch to the right of the control you want to set. The eye dropper icon appears. In the Viewer:

- **Ctrl/Cmd**+click to sample a single pixel from the node's output.
- **Ctrl/Cmd**+**Shift**+drag to sample a region of pixels from the node's output.
- **Ctrl/Cmd**+**Alt**+click to sample a single pixel from the node's input while viewing its output.
- **Ctrl/Cmd**+**Alt**+**Shift**+drag to sample a region of pixels from the node's input while viewing its output.
- **Ctrl/Cmd**+ right-click cancels pixel selections.

You can also create this node by pressing **G** on the Node Graph.

See also [ColorCorrect](#) and [Multiply](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence whose tonal range you want to define.                                                                                                                                                                                                                                                                                                                          |
|                 | mask            | <p>An optional image to use as a mask. By default, the color correction is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| channels     | channels         | rgb           | <p>The color correction is only applied to these channels.</p> <p>You can use the checkboxes on the right to select individual channels.</p>                                                                                                                                                                                                                                                                                                             |
| blackpoint   | blackpoint       | 0             | <p>Sets the black point (typically the darkest pixel). Any pixels of this value are set to 0. In other words, this color is turned into pure black.</p> <p>Typically, you would set this by sampling the darkest pixels in the Viewer. To find these in your image, you may want to temporarily increase the gain in the Viewer controls until only the darkest pixels are visible. Adjusting the Viewer gain does not affect the colors you sample.</p> |
| whitepoint   | whitepoint       | 1             | <p>Sets the white point (typically the lightest pixel). Any pixels of this value are set to 1. In other words, this color is turned into pure white.</p>                                                                                                                                                                                                                                                                                                 |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | Typically, you would set this by sampling the brightest pixels in the Viewer. To find these in your image, you may want to temporarily lower the gamma in the Viewer controls until only the brightest pixels are visible. Adjusting the Viewer gamma does not affect the colors you sample.                                                                                                                                                                                           |
| lift         | black            | 0             | <p>Any pixels that are black are set to this color.</p> <p>This allows you to, for example, match the tonal range of one clip with that of another. First, set <b>blackpoint</b> to the darkest pixel in the image whose colors you want to change (pressing <b>Alt</b> to make sure you sample from the input). Then, set this control to the darkest pixel in the image whose tonal range you want to match (not pressing <b>Alt</b> to make sure you sample from the output).</p>   |
| gain         | white            | 1             | <p>Any pixels that are white are set to this color.</p> <p>This allows you to, for example, match the tonal range of one clip with that of another. First, set <b>whitepoint</b> to the lightest pixel in the image whose colors you want to change (pressing <b>Alt</b> to make sure you sample from the input). Then, set this control to the lightest pixel in the image whose tonal range you want to match (not pressing <b>Alt</b> to make sure you sample from the output).</p> |
| multiply     | multiply         | 1             | Multiplies the result of the Grade node by this factor. This has the effect of lightening the result while preserving the black point.                                                                                                                                                                                                                                                                                                                                                 |
| offset       | add              | 0             | Offsets the result of the Grade node. Offsetting is to add a fixed value to the result, which, in effect lightens the whole image. You can also add a negative value to the result, in which case the whole image gets darker.                                                                                                                                                                                                                                                         |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                            |
|----------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gamma          | gamma            | 1             | Applies a constant gamma value to the result of the Grade node. This lightens or darkens the midtones.                                                              |
| reverse        | reverse          | disabled      | Allows you to copy and paste this node and invert its effect further downstream. This performs the opposite gamma correction, followed by the opposite linear ramp. |
| black clamp    | black_clamp      | enabled       | When enabled, any output values that are lower than 0 are set to 0.                                                                                                 |
| white clamp    | white_clamp      | disabled      | When enabled, any output values that are higher than 1 are set to 1.                                                                                                |
| mask           | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                       |
|                | maskChannelInput | none          | The channel to use as a mask. By default, the color correction is limited to the non-black areas of this channel.                                                   |
| inject         | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                        |
| invert         | invert_mask      | disabled      | Inverts the use of the mask channel so that the color correction is limited to the non-white areas of the mask.                                                     |
| fringe         | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask.                                        |
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                            |
|                | unpremult        | none          | The image is divided by this channel before being                                                                                                                   |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | <p>processed, and multiplied again afterwards.</p> <p>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate doing the color correction before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.</p> <p>If you are using unpremultiplied input images, you should leave this set to <b>none</b>.</p> |
| invert       | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full color correction at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

# HistEQ

Alters the histogram of the input image to be flat. This process is called histogram equalization. It can be useful for increasing the contrast in an image, for example, if the background and foreground in the image are both bright or both dark.

## Inputs and Controls

| Connection Type | Connection Name | Function                        |
|-----------------|-----------------|---------------------------------|
| Input           | unnamed         | The image sequence to equalize. |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                      |
|-------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------|
| HistEQ Tab        |                  |               |                                                                                                                               |
| Histogram Entries | histeqbins       | 4096          | Adjust the number of entries in the histogram.                                                                                |
| mask              | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> . |
|                   | maskChannelInput | none          | The channel to use as a mask. By default, the color correction is limited to the non-black areas of this channel.             |
| invert mask       | invert_mask      | disabled      | Inverts the use of the mask channel so that the color correction is limited to the non-white areas of the mask.               |

# Histogram

Histogram graphs the number of pixels at each brightness level. This is a useful gauge to see whether the input image has a good distribution of shadows, midtones, and highlights.

You can also use this node to adjust the tonal range of the input image. Note, however, that Histogram clamps superblacks and superwhites. If you don't want this to happen, use the [Grade](#) node instead.

**Tip:** You can also use the histogram panel available in the content menu  under **Windows > Histogram**.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence whose tonal range you want to examine or adjust.                                                                                                                                                                                                                                                                                                               |
|                 | mask            | <p>An optional image to use as a mask. By default, the color correction is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|              |                  |               | <p>(lightens or darkens the midtones).</p> <p>The histogram updates as you adjust these controls.</p>                                                                                                                                                                                                                                                                                                                                                            |
| output range | out              | 0, 1          | <p>Sets the range to which the <b>input range</b> is mapped. This can be used to shorten the image's tonal range, which has the effect of removing pure black and white and decreasing contrast.</p> <p>Any pixels that are black are set to the value on the left. This makes shadows lighter.</p> <p>Any pixels that are white are set to the value on the right. This makes highlights darker.</p> <p>The histogram updates as you adjust these controls.</p> |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                    |
|              | maskChannelInput | none          | The channel to use as a mask. By default, the color correction is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                                                                                                                |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                                                                                                                     |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel so that the color correction is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                                                                  |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.                                                                                                                                                                                                                                                                                                                                                                                                     |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |               | When disabled, the effect is applied to the entire mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                | unpremult        | none          | <p>The image is divided by this channel before being processed, and multiplied again afterwards.</p> <p>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate doing the color correction before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.</p> <p>If you are using unpremultiplied input images, you should leave this set to <b>none</b>.</p> |
| invert         | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| mix            | mix              | 1             | Dissolves between the original image at 0 and the full color correction at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

# HSVTool

HSVTool lets you simultaneously adjust hue, saturation, and value components from a single control panel. It also features a color replacement tool and makes an excellent keyer.

The main strength of this node is the precision it offers in limiting corrections to a narrow sample of colors. You can limit the correction to certain hues by sampling a few pixels and then shifting their values. Because you limit the color range, the surrounding image is generally unaffected by the shift.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                   |
|-----------------|-----------------|------------------------------------------------------------|
| Input           | unnamed         | The image sequence whose HSV components you are adjusting. |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                      |

# HueCorrect

Lets you make precision adjustments to the levels of saturation in a range of hues. You do so via edits to a series of suppression curves. The horizontal axis represents the original, or input, saturation, and the vertical axis represents the new, or output, saturation.

By choosing which curve you edit and how much of that curve you alter, you can precisely limit the influence of the effect.

For the compositor, HueCorrect is obviously of greatest use in diminishing green, blue, or redscreen spill.

For the times when you just want to correct the saturation component and don't require limiting the correction to any particular range of hues, you can also use the [Saturation](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to correct.                                                                                                                                                                                                                                                                                                                                              |
|                 | mask            | <p>An optional image to use as a mask. By default, the correction is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

By default, the correction is limited to the non-black areas of this channel.                                                                                                                                                                        |
| inject         | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                       |
| invert         | invert_mask      | disabled      | Inverts the use of the mask channel so that the correction is limited to the non-white areas of the mask.                                                                                                                                                                          |
| fringe         | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask.                                                                                                                                                       |
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                           |
|                | unpremult        | none          | The image is divided by this channel before being processed, and multiplied again afterwards.<br><br>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate applying the correction before |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                           |
|---------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                  |               | <p>the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one HueShift node.</p> <p>If you are using unpremultiplied input images, you should leave this set to <b>none</b>.</p> |
| invert        | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                    |
| mix luminance | N/A              | enabled       | Enables the <b>mix luminance</b> slider. Disabling this checkbox is the same as setting <b>mix luminance</b> to 0.                                                                                                                                                                                 |
|               | mix_luminance    | 0             | Controls how much of the original luminance is preserved after the color correction. A value of 0 means the altered luminance is used in the output image. A value of 1 produces a luminance value close to that of the original input image.                                                      |
| mix           | mix              | 1             | Dissolves between the original image at 0 and the full correction at 1.                                                                                                                                                                                                                            |

# HueShift

HueShift transforms the input image's colorspace. It works by transforming the colors to CIE XYZ space and then doing simple scales and rotates on the space. In XYZ space, X and Z control the color and Y is the brightness.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to hue shift.                                                                                                                                                                                                                                                                                                                                       |
|                 | mask            | <p>An optional image to use as a mask. By default, the shift is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)          | Knob (Scripting) | Default Value | Function                                                                                                                                                                                             |
|-----------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HueCorrect Tab        |                  |               |                                                                                                                                                                                                      |
| channels              | channels         | rgb           | <p>The shift is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> |
| input graypoint       | ingray           | 0.25          | After converting to CIE XYZ space, the colors are skewed so that this gray color is $X = Z = 0$ .                                                                                                    |
| output graypoint      | outgray          | 0.25          | After all other operations are completed, the CIE XYZ space is skewed to the output gray point so a fully desaturated images is tinted the specified color.                                          |
| overall saturation    | saturation       | 1             | Multiplies X and Z by the specified overall saturation value.                                                                                                                                        |
| color axis rgb        | color            | 1, 0, 0       | Adjusts the saturation in one direction in the XZ plane by setting this color axis. Adjust the <b>saturation along axis</b> control to affect the saturation.                                        |
| saturation along axis | color_saturation | 1             | Adjusts the color saturation in the direction specified by the <b>color axis</b> control.                                                                                                            |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| hue rotation   | hue_rotation     | 0             | Adjusts the rotation around the Y axis, which is mostly useful for making psychedelic effects.                                                                                                                                                                                                                                                                                                                                                                                 |
| brightness     | brightness       | 1             | Multiplies the image by the specified value.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| mask           | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                  |
|                | maskChannelInput | none          | The channel to use as a mask. By default, the correction is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                                                                                                                                    |
| inject         | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                                                                                                                                   |
| invert         | invert_mask      | disabled      | Inverts the use of the mask channel so that the correction is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                                                                                      |
| fringe         | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask.                                                                                                                                                                                                                                                                                                                                                   |
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                       |
|                | unpremult        | none          | The image is divided by this channel before being processed, and multiplied again afterwards.<br><br>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate applying the correction before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one HueShift node. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                  |
|--------------|------------------|---------------|-------------------------------------------------------------------------------------------|
|              |                  |               | If you are using unpremultiplied input images, you should leave this set to <b>none</b> . |
| invert       | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                           |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full shift at 1.                        |

# Invert

Inverts a channel's values. To invert a channel is to subtract its values from one, which causes its blacks to become white and its whites to become black. In the course of building a script, you'll have frequent need to invert mattes in particular.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | <p>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate doing the inversion before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.</p> <p>If you are using unpremultiplied input images, you should leave this set to <b>none</b>.</p> |
| invert       | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full inversion at 1.                                                                                                                                                                                                                                                                                                                                                                                                            |

## Log2Lin

Whenever you read a clip into a script, it is automatically converted to Nuke's native color space, which is 32-bit per channel RGB, a linear format. This conversion takes place even if the clip you read in is in the Kodak Cineon format, which is a logarithmic format. The reverse of this conversion, called a lin-to-log conversion, also automatically takes place when you write the processed element back out of the script - that is, Nuke automatically converts it back into a Cineon element.

Nuke uses the Kodak-recommended settings when making Cineon conversions in either direction. It's rare that you would want to override these settings, but if it becomes necessary you can use the Log2Lin node. If you do, you should also check **raw data** (or set **colorspace** to **linear**) in the Read and Write node controls to skip the automatic conversion.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                  |

# MatchGrade

MatchGrade (NukeX and Nuke Studio only) allows you to automatically calculate a grade to match the colors in the **Source** input to the colors in the **Target** input. You can use MatchGrade to:

- extract a baked-in grade if the **Target** clip that you want to match to contains the same frames as the **Source** clip,
- match the grade between two different clips to create the same look,
- mask the grade to only match certain elements between the **Source** and **Target** clips, and
- export LUT or CDL files to re-use the calculated grade elsewhere.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                        |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | Target          | <p>The image sequence you want the <b>Source</b> clip to match.</p> <p>When <b>Task</b> is set to <b>Match Graded Source</b>, this should be a graded version of the <b>Source</b> footage.</p> |

# MinColor

Calculates the difference between the darkest value in the input image and the **target** value, and then adds the result to the image. This sets the darkest pixel to the **target** value.

To have MinColor calculate the darkest pixels and remember them, click **Find Pixel Delta**.

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | unnamed         | The image sequence to which the minimum is applied. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                |
|--------------|------------------|---------------|---------------------------------------------------------|
| MinColor Tab |                  |               |                                                         |
| search       | channels         | rgb           | Only these channels are searched for the minimum value. |

# Multiply

Lets you multiply a channel's values by a given factor, which has the effect of lightening the channel while preserving the black point. This operation is also known as gain.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence whose channel values you want to multiply.                                                                                                                                                                                                                                                                                                                   |
|                 | mask            | <p>An optional image to use as a mask. By default, the multiplication is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                      |
|----------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Multiply Tab   |                  |               |                                                                                                                                                                                                               |
| channels       | channels         | all           | <p>The multiplication is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> |
| value          | value            | 0             | The factor by which you want to multiply the values in the above channels.                                                                                                                                    |
| mask           | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                 |
|                | maskChannelInput | none          | The channel to use as a mask. By default, the multiplication is limited to the non-black areas of this channel.                                                                                               |
| inject         | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                  |
| invert         | invert_mask      | disabled      | Inverts the use of the mask channel so that the multiplication is limited to the non-white areas of the mask.                                                                                                 |
| fringe         | fringe           | disabled      | <p>When enabled, only apply the effect to the edge of the mask.</p> <p>When disabled, the effect is applied to the entire mask.</p>                                                                           |
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                      |
|                | unpremult        | none          | <p>The image is divided by this channel before being processed, and multiplied again afterwards.</p> <p>If you are using premultiplied input images, you may</p>                                              |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | <p>want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate doing the gain adjustment before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.</p> <p>If you are using unpremultiplied input images, you should leave this set to <b>none</b>.</p> |
| invert       | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                    |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full multiplication effect at 1.                                                                                                                                                                                                                                                                                                                                                 |

# OCIOCDLTransform

Applies an ASC CDL (American Society of Cinematographers Color Decision List) grade based on the OpenColorIO Library. For more information, see <https://opencolorio.org>.

**Note:** There are a number of NDK examples covering OCIO workflows that ship with the Nuke developer documentation, which can be found here:  
 <install\_directory>/Documentation/NDKExamples/Plugins/00b\_8source.html

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to receive the CDL transform.                                                                                                                                                                                                                                                                                                                                 |
|                 | mask            | <p>An optional image to use as a mask. By default, the CDL transform is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as a triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)         | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                   |
|----------------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OCIOCDLTransform Tab |                  |               |                                                                                                                                                                                                                            |
| channels             | channels         | rgb           | <p>The CDL transform is applied only to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p>               |
| slope                | slope            | 1             | Adjusts the gain for the entire image.                                                                                                                                                                                     |
| offset               | offset           | 0             | Adjusts the offset for the entire image.                                                                                                                                                                                   |
| power                | power            | 1             | Adjusts the gamma for the entire image.                                                                                                                                                                                    |
| saturation           | saturation       | 1             | Adjusts the saturation for the entire image.                                                                                                                                                                               |
| direction            | direction        | forward       | Select <b>Inverse</b> to invert the transform.                                                                                                                                                                             |
| working space        | working_space    | linear        | Sets the color space in which the file is applied. The input is transformed from scene linear to the selected working space, the file color transform is applied, and then the result is transformed back to scene linear. |
| read from file       | read_from_file   | disabled      | Enable this to load color correction information from a .cc or .ccc file.                                                                                                                                                  |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                              |
|---------------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file                | file             | none          | The ASC CDL file to use for the transform. This can be a .cc or .ccc file.                                                                                                                                                            |
| cccid               | cccid            | none          | If the ASC CDL file is a .ccc (Color Correction Collection) file, specify the cccid to look up here.                                                                                                                                  |
| select cccid        | select_cccid     | N/A           | Click to open the cccid dialog and select the cccid from the dropdown menu.<br><br>You can view the <b>Slope, Offset, Power</b> and <b>Saturation</b> settings for the chosen .ccc from within this dialog. These cannot be modified. |
| export grade as .cc | export_cc        | N/A           | Exports the grade as a .cc (Color Correction) file.                                                                                                                                                                                   |
| mask                | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                         |
|                     | maskChannelInput | none          | The channel to use as a mask. By default, the colorspace conversion is limited to the non-black areas of this channel.                                                                                                                |
| inject              | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                          |
| invert              | invert_mask      | disabled      | Inverts the use of the mask channel so that the colorspace conversion is limited to the non-white areas of the mask                                                                                                                   |
| fringe              | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask.                                                                                                          |
| (un)premult by      | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                              |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | unpremult        | none          | <p>The image is divided by this channel before being processed, and multiplied again afterwards.</p> <p>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate doing the color conversion before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.</p> <p>If you are using unpremultiplied input images, you should leave this set to <b>none</b>.</p> |
| invert       | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full colorspace conversion at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

# OCIOColorSpace

Much like the standard ColorSpace node, you can use the OCIOColorSpace node for converting an image sequence from one colorspace to another. The OCIOColorSpace node is based on the OpenColorIO library. For more information, see <https://opencolorio.org>.

**Note:** There are a number of NDK examples covering OCIO workflows that ship with the Nuke developer documentation, which can be found here:  
`<install_directory>/Documentation/NDKExamples/Plugins/00b_8source.html`

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to receive the colorspace transform.                                                                                                                                                                                                                                                                                                                                 |
|                 | mask            | <p>An optional image to use as a mask. By default, the colorspace transform is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as a triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)       | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                        |
|--------------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OCIOColorSpace Tab |                  |               |                                                                                                                                                                                                                                                                                                                 |
| channels           | channels         | rgb           | <p>The ColorSpace transform is applied only to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p>                                                                                             |
| input              | in_colorspace    | linear        | <p>Specifies the colorspace of your input image.</p> <div>  <p><b>Note:</b> The control label has been updated, but the knob name currently remains the same. The knob name will also change in a future release.</p> </div> |
| output             | out_colorspace   | linear        | Specifies the colorspace you want to convert the image to.                                                                                                                                                                                                                                                      |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   |                  |               |  <b>Note:</b> The control label has been updated, but the knob name currently remains the same. The knob name will also change in a future release.                                                                                                                                                                                                                                |
| swap input/output | swap             | n/a           | Swaps the selected <b>input</b> and <b>output</b> colorspace knobs. This can be useful if you're doing certain comp tasks that work better in certain colorspace, such as grading. For example, you might go from <b>ACEScc</b> (input) to <b>scene_linear</b> (output) in a OCIOColorspace node, perform a Grade node adjustment, copy the first Colorspace node after the Grade node, and click the <b>swap input/output</b> button to go back to <b>ACEScc</b> . |
| mask              | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                       |
|                   | maskChannelInput | none          | The channel to use as a mask. By default, the colorspace conversion is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                                                                                                              |
| inject            | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                                                                                                                        |
| invert            | invert_mask      | disabled      | Inverts the use of the mask channel so that the colorspace conversion is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                                                                |
| fringe            | fringe           | disabled      | <p>When enabled, only apply the effect to the edge of the mask.</p> <p>When disabled, the effect is applied to the entire mask.</p>                                                                                                                                                                                                                                                                                                                                 |
| (un)premult by    | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the                                                                                                                                                                                                                                                                                                                                                                     |

# OCIODisplay

Uses the OpenColorIO library to apply a colorspace conversion to an image sequence, so that it can be accurately represented on a specific display device. The OCIODisplay node is based on the OpenColorIO library. For more information, see <https://opencolorio.org>.

**Note:** There are a number of NDK examples covering OCIO workflows that ship with the Nuke developer documentation, which can be found here:  
`<install_directory>/Documentation/NDKExamples/Plugins/00b_8source.html`

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to receive the colorspace conversion.                                                                                                                                                                                                                                                                                                                                 |
|                 | mask            | <p>An optional image to use as a mask. By default, the colorspace conversion is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as a triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                               |
|------------------|------------------|---------------|----------------------------------------------------------------------------------------|
| OCIODisplay Tab  |                  |               |                                                                                        |
| input colorspace | colorspace       | linear        | Specifies in the colorspace of your input sequence.                                    |
| display device   | display          | default       | Specifies the colorspace of the display device that will be used to view the sequence. |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                            |
|------------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| view transform   | view             | sRGB          | Specifies the colorspace transform to apply to the scene or image.                                                                                                                                                                                  |
| invert direction | invert           | disabled      | Select <b>invert direction</b> to invert the transform.                                                                                                                                                                                             |
| gain             | gain             | 1             | Set the amount of exposure adjustment applied before the display transform.                                                                                                                                                                         |
| gamma            | gamma            | 1             | Set the amount of gamma correction applied after the display transform.                                                                                                                                                                             |
| saturation       | saturation       | 1             | Set the amount of saturation adjustment applied before the display transform.                                                                                                                                                                       |
| channel view     | channel_selector | RGB           | Specifies the channels to view before the display transform.                                                                                                                                                                                        |
| layer            | layer            | rgba          | Specifies the layer to process. This should be a layer with RGB data.                                                                                                                                                                               |
| Context Tab      |                  |               |                                                                                                                                                                                                                                                     |
| key1             | key1             | n/a           | Allows you to add variables to register certain viewer processes by creating a custom <b>config.ocio</b> and specifying the variable in the <b>to_reference</b> file transform.<br><br>See Nuke's <a href="#">online help</a> for more information. |

| value4           | value4           | n/a           |                                                                                                                                                                                                                                                     |

# OCIOFileTransform

Uses the OpenColorIO library to load a colorspace conversion from a file (usually a 1D or 3D LUT) and apply it. You can also load other file-based transformations, for example an ASC ColorCorrection XML. File transforms are applied without any input or output colorspace handling. If the file expects log-encoded pixels, but you apply the node to a linear image, you will get incorrect results. The OCIOFileTransform node is based on the OpenColorIO library.

For more information, see: <https://opencolorio.org>

**Note:** There are a number of NDK examples covering OCIO workflows that ship with the Nuke developer documentation, which can be found here:  
`<install_directory>/Documentation/NDKExamples/Plugins/00b_8source.html`

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to receive the colorspace conversion.                                                                                                                                                                                                                                                                                                                                        |
|                 | mask            | <p>An optional image to use as a mask. By default, the colorspace conversion is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as a triangle on the right side of the node, but when you drag it, it turns into an arrow labeled <b>mask</b>. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)          | Knob (Scripting) | Default Value | Function                                              |
|-----------------------|------------------|---------------|-------------------------------------------------------|
| OCIOFileTransform Tab |                  |               |                                                       |
| channels              | channels         | rgb           | The file transform is applied only to these channels. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | If you set this to something other than <b>all</b> or <b>none</b> , you can use the checkboxes on the right to select individual channels.                                                                                                                                                                                                                                                                                                                                                                                                            |
| file         | file             | none          | <p>The file to use for the transform. Supported formats:</p> <ul style="list-style-type: none"> <li>• .3dl (Flame)</li> <li>• .3dl (Lustre)</li> <li>• .ccc (ColorCorrectionCollection)</li> <li>• .cc (ColorCorrection)</li> <li>• .csp (Cinespace)</li> <li>• .lut (Houdini)</li> <li>• .itx (Iridas_itx)</li> <li>• .cube (Iridas_cube)</li> <li>• .mga (Pandora_mga)</li> <li>• .m3d (Pandora_m3d)</li> <li>• .spi1d (spi1d)</li> <li>• .spi3d (spi3d)</li> <li>• .spimtx (spimtx)</li> <li>• .cub (Truelight)</li> <li>• .vf (Nukevf)</li> </ul> |

**Note:** FilmLight and Foundry have elected to no longer bundle Truelight as of Nuke 11. The Truelight node has been superseded by the free version of Baselight for Nuke which itself can import a BLG (Basilight Linked Grade) that can contain a Truelight strip, plus optionally a lot more in terms of creative grading intent. Together with OpenColorIO and the native Nuke Vectorfield node we feel all the Nuke color management issues for which the Truelight node was originally intended are now addressed.

For further information on Baselight for Nuke, please contact [plugin-support@filmlight.ltd.uk](mailto:plugin-support@filmlight.ltd.uk)

|                  |               |          |                                                         |
|------------------|---------------|----------|---------------------------------------------------------|
| invert direction | invert        | disabled | Select <b>invert direction</b> to invert the transform. |
| interpolation    | interpolation | linear   | Specifies the interpolation method. This is ignored if  |

| Control (UI)   | Knob (Scripting) | Default Value         | Function                                                                                                                                                                                                                                                          |
|----------------|------------------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |                       | <p>the file used is not a LUT. The following interpolation methods are listed from fastest to most accurate:</p> <ul style="list-style-type: none"> <li>• <b>nearest</b></li> <li>• <b>linear</b></li> <li>• <b>tetrahedral</b></li> <li>• <b>best</b></li> </ul> |
| working space  | working_space    | scene_linear (linear) | Sets the color space in which the file is applied. The input is transformed from scene linear to the specified <b>working space</b> , the file color transform is applied, and then the result is transformed back to scene linear.                               |
| mask           | N/A              | disabled              | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                     |
|                | maskChannelInput | none                  | The channel to use as a mask. By default, the colorspace conversion is limited to the non-black areas of this channel.                                                                                                                                            |
| inject         | inject           | disabled              | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                      |
| invert         | invert_mask      | disabled              | Inverts the use of the mask channel so that the colorspace conversion is limited to the non-white areas of the mask.                                                                                                                                              |
| fringe         | fringe           | disabled              | <p>When enabled, only apply the effect to the edge of the mask.</p> <p>When disabled, the effect is applied to the entire mask.</p>                                                                                                                               |
| (un)premult by | N/A              | disabled              | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                          |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | unpremult        | none          | <p>The image is divided by this channel before being processed, and multiplied again afterwards.</p> <p>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate doing the color conversion before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.</p> <p>If you are using unpremultiplied input images, you should leave this set to <b>none</b>.</p> |
| invert       | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full colorspace conversion at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

# OCIOLogConvert

Sometimes log data is required for certain processing operations, like plate resizing or pulling keys. Usually a colorspace is provided specifically for these operations. The OCIOLogConvert node uses the OpenColorIOlibrary to convert from compositing\_log to scene\_linear, or the reverse. For more information, see <https://opencolorio.org>.

**Note:** There are a number of NDK examples covering OCIO workflows that ship with the Nuke developer documentation, which can be found here:  
`<install_directory>/Documentation/NDKExamples/Plugins/00b_8source.html`

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to receive the colorspace conversion.                                                                                                                                                                                                                                                                                                                                       |
|                 | mask            | <p>An optional image to use as a mask. By default, the colorspace transform is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as a triangle on the right side of the node, but when you drag it, it turns into an arrow labeled <b>mask</b>. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)       | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                          |
|--------------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OCIOLogConvert Tab |                  |               |                                                                                                                                                                                                                                                   |
| channels           | channels         | rgb           | <p>The colorspace conversion is applied only to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p>                              |
| operation          | operation        | log to lin    | <p>Specifies the operation to perform:</p> <ul style="list-style-type: none"> <li>• <b>log to lin</b> - Performs a log to linear colorspace conversion.</li> <li>• <b>lin to log</b> - Performs a linear to log colorspace conversion.</li> </ul> |
| mask               | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                     |
|                    | maskChannelInput | none          | The channel to use as a mask. By default, the colorspace conversion is limited to the non-black areas of this channel.                                                                                                                            |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| inject         | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| invert         | invert_mask      | disabled      | Inverts the use of the mask channel so that the colorspace conversion is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| fringe         | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                | unpremult        | none          | The image is divided by this channel before being processed, and multiplied again afterwards.<br><br>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate doing the color conversion before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.<br><br>If you are using unpremultiplied input images, you should leave this set to <b>none</b> . |
| invert         | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| mix            | mix              | 1             | Dissolves between the original image at 0 and the full colorspace conversion at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

# OCIOLookTransform

OCIOLookTransform applies a creative colorspace transform using a predefined look in the OCIO config file. A look is a named color transform intended to modify the 'look' of an image in a creative way, rather than a technically or mathematically defined colorspace conversion. Examples of looks include a neutral grade applied to film scans prior to VFX work and per-shot digital intermediate (DI) grades required by the director's vision applied before a Viewer transform, such as rec1886.

OCIOLooks are predefined in OCIO config files before use and often reference per-shot or per-sequence LUTs or color corrections (CC). See <https://opencolorio.org/> for more information on look configuration examples.

**Note:** There are a number of NDK examples covering OCIO workflows that ship with the Nuke developer documentation, which can be found here:

|              | unpremult        | none          | <p>The image is divided by this channel before being processed, and multiplied again afterwards.</p> <p>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate doing the color conversion before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.</p> <p>If you are using unpremultiplied input images, you should leave this set to <b>none</b>.</p> |
| invert       | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full colorspace conversion at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

# OCIONamedTransform

OCIONamedTransform uses the new **NamedTransforms** in the OCIO configs shipped with Nuke to emulate older methods of color management that ignored the RGB primaries and simply applied one-dimensional transformations. These NamedTransforms have been added to the config as sometimes it is helpful to include one or more transforms in a config that are essentially stand-alone transforms that do not have a fixed relationship to a reference space or a process space. An example would be a utility curve transform where the intent is to simply apply a LUT1D without any conversion to a reference space.

**Note:** There are a number of NDK examples covering OCIO workflows that ship with the Nuke developer documentation, which can be found here:

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to receive the colorspace conversion.                                                                                                                                                                                                                                                                                                                                        |
|                 | mask            | <p>An optional image to use as a mask. By default, the colorspace conversion is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as a triangle on the right side of the node, but when you drag it, it turns into an arrow labeled <b>mask</b>. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)           | Knob (Scripting) | Default Value | Function                                                                                                                          |
|------------------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------|
| OCIONamedTransform Tab |                  |               |                                                                                                                                   |
| channels               | channels         | rgb           | <p>The transform is applied only to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>,</p> |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                   |
|-----------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                  |               | you can use the checkboxes on the right to select individual channels.                                                                                                                                                                                                                                                     |
| named transform | named_transform  | none          | <p>Sets the named transform to apply to the input image. Select the family name first and then transform from the dropdown. For example, <b>Input &gt; ARRI &gt; LogC3 - Curve (EI800)</b>.</p> <p>The transforms available are contained in the selected OCIO config file under the <b>named_transforms:</b> section.</p> |
| mask            | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                              |
|                 | maskChannelInput | none          | The channel to use as a mask. By default, the colorspace conversion is limited to the non-black areas of this channel.                                                                                                                                                                                                     |
| inject          | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                               |
| invert          | invert_mask      | disabled      | Inverts the use of the mask channel so that the colorspace conversion is limited to the non-white areas of the mask.                                                                                                                                                                                                       |
| fringe          | fringe           | disabled      | <p>When enabled, only apply the effect to the edge of the mask.</p> <p>When disabled, the effect is applied to the entire mask.</p>                                                                                                                                                                                        |
| (un)premult by  | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                   |
|                 | unpremult        | none          | The image is divided by this channel before being processed, and multiplied again afterwards.                                                                                                                                                                                                                              |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | <p>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate doing the color conversion before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.</p> <p>If you are using unpremultiplied input images, you should leave this set to <b>none</b>.</p> |
| invert       | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full transform at 1.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Context Tab  |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| key1         | key1             | n/a           | <p>Allows you to add variables to register certain viewer processes by creating a custom <b>config.ocio</b> and specifying the variable in the <b>to_reference</b> file transform.</p> <p>See Nuke's <a href="#">online help</a> for more information.</p>                                                                                                                                                                                                                               |
| value1       | value1           | n/a           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| key2         | key2             | n/a           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

# PLogLin

Converts between logarithmic and linear encoding (colorspace) based on a single gray point rather than the standard Cineon formula with a black point and white point (the formula that the [Log2Lin](#) node uses). This method is frequently referred to as *Josh Pines log conversion*.

Like the Log2Lin node, you can use this node to override Nuke's default Cineon-conversion. When doing so, ensure that the Read or Write node is not applying an automatic colorspace conversion based on its assumptions about the file format. You can do this by setting **colorspace** on the Read or Write to **linear** or enabling its **raw** option. PLogLin uses the formula posted on the EXR list at:

<http://lists.gnu.org/archive/html/openexr-devel/2005-03/msg00006.html>

See also [Log2Lin](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | <ul style="list-style-type: none"> <li>• If you are using this node to convert your input file to linear, attach the Read node here.</li> <li>• If you are using this node to convert to logarithmic for output, attach the node whose result you want to output here.</li> </ul>                                                                                                      |
|                 | mask            | <p>An optional image to use as a mask. By default, the colorspace conversion is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |
| Output          |                 | <ul style="list-style-type: none"> <li>• If you are using this node to convert your input file to linear, attach any nodes you want to use to process the image here.</li> <li>• If you are using this node to convert to logarithmic for output, attach the Write node here.</li> </ul>                                                                                               |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                      |
|--------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PLogLin Tab  |                  |               |                                                                                                                                                                                                               |
| channels     | channels         | all           | <p>The PLogLin effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> |

| Control (UI)           | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                    |
|------------------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| operation              | operation        | log to lin    | Select the operation you want the node to perform: <ul style="list-style-type: none"> <li>• <b>log to lin</b> - convert the input from logarithmic to linear colorspace.</li> <li>• <b>lin to log</b> - convert the input from linear to logarithmic colorspace.</li> </ul> |
| linear reference value | linref           | 0.18          | Set this to the linear value that corresponds with the <b>log reference value</b> .<br><br>For example, you could leave this at 0.18 (mid-gray) and enter the logarithmic value that corresponds with 0.18 in the <b>log reference value</b> field.                         |
| log reference value    | logref           | 445           | Set this to the logarithmic value that corresponds with the <b>linear reference value</b> .                                                                                                                                                                                 |
| negative gamma         | ngamma           | 0.6           | The film response gamma value.                                                                                                                                                                                                                                              |
| density per code value | density          | 0.002         | The change in the negative gamma for each log space code value.                                                                                                                                                                                                             |
| mask                   | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                               |
|                        | maskChannelInput | none          | The channel to use as a mask. By default, the colorspace conversion is limited to the non-black areas of this channel.                                                                                                                                                      |
| inject                 | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                |
| invert                 | invert_mask      | disabled      | Inverts the use of the mask channel so that the colorspace conversion is limited to the non-white areas of the mask.                                                                                                                                                        |
| fringe                 | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.                                                                                                                                                                                                                |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                |                  |               | When disabled, the effect is applied to the entire mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                | unpremult        | none          | <p>The image is divided by this channel before being processed, and multiplied again afterwards.</p> <p>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate doing the colorspace conversion before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.</p> <p>If you are using unpremultiplied input images, you should leave this set to <b>none</b>.</p> |
| invert         | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| mix            | mix              | 1             | Dissolves between the original image at 0 and the full colorspace conversion at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

# Posterize

Posterize reduces the color resolution of an image. This creates abrupt changes from one tone to another, producing a dramatic graphic effect.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to posterize.                                                                                                                                                                                                                                                                                                                                                  |
|                 | mask            | <p>An optional image to use as a mask. By default, the posterize effect is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                        |
|---------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Posterize Tab |                  |               |                                                                                                                                                                                                                 |
| channels      | channels         | all           | <p>The posterize effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> |
| Colors        | Colors           | 16            | The bit depth to use. For example, setting this control to 8 independently limits each affected channel to 256 colors.                                                                                          |
| mask          | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                   |
|               | maskChannelInput | none          | The channel to use as a mask. By default, the posterize effect is limited to the non-black areas of this channel.                                                                                               |
| inject        | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                    |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.<br><br>If you are using unpremultiplied input images, you should leave this set to <b>none</b> . |
| invert         | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| mix            | mix              | 1             | Dissolves between the original image at 0 and the full posterize effect at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# RolloffContrast

Applies a contrast curve, with smooth falloff at the low and high ends, equally across all channels in the input image. The **center** value controls the overall brightness of the colors and the **contrast** value increases or decreases the contrast of the image. Use **soft clip** to control the amount of rolloff and check **override values** to adjust the tension and extent of the **soft clip** curve.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to receive the rolloff.                                                                                                                                                                                                                                                                                                                                         |
|                 | mask            | <p>An optional image to use as a mask. By default, the contrast changes are limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                              |
|---------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RolloffContrast Tab |                  |               |                                                                                                                                                                                                       |
| channels            | channels         | rgba          | <p>The effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> |
| range               | range            | 1             | Values between 0 and the input value use a lookup table to reduce processing time.                                                                                                                    |
| contrast            | contrast         | 1             | Higher values increase the contrast. Values closer to 0 reduce the contrast.                                                                                                                          |
| center              | center           | 0.5           | The <b>center</b> value is located at the center of the contrast curve by default and controls the overall brightness of the colors.                                                                  |
| soft clip           | soft_clip        | 0             | The amount of roll off from the linear curve near the ends, softening the effect of the contrast.                                                                                                     |
| override values     | value_override   | disabled      | If enabled, custom values below override the computed values.                                                                                                                                         |

| Control (UI)               | Knob (Scripting) | Default Value | Function                                                                                                                                                  |
|----------------------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| slope mag 1 low shoulder   | slope_mag_low1   | 0.80000001    | A value from 0 to 1 that controls where the interior control points are in the bezier.                                                                    |
| slope mag 2 low shoulder   | slope_mag_low2   | 0.0025        | A value from 0 to 1 that controls where the interior control points are in the bezier.                                                                    |
| blank point percentage     | black_low        | 1             | A value from 0 to 1 that controls the location of the black point. Computed as the distance between the origin and the contrast line zero crossing.       |
| slope mag 1 upper shoulder | slope_mag_high1  | 1             | A value from 0 to 1 that controls where the interior control points are in the upper bezier.                                                              |
| slope mag 2 upper shoulder | slope_mag_high2  | 0.80000001    | A value from 0 to 1 that controls where the interior control points are in the upper bezier.                                                              |
| white point percentage     | white_high       | 1             | A value from 0 to 1 that controls the location of the white point. Computed as the distance between the 1,1 point and the contrast line $y = 0$ crossing. |
| mask                       | N/A              | disabled      | Enable the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                              |
|                            | maskChannelInput | none          | The channel to use as a mask. By default, the contrast effect is limited to the non-black areas of this channel.                                          |
| inject                     | inject           | disabled      | Copy the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                |
| invert                     | invert_mask      | disabled      | Invert the use of the mask channel, so that the contrast effect is limited to the non-white areas of the mask.                                            |
| fringe                     | fringe           | disabled      | Blur the edges of the mask.                                                                                                                               |
| (un)premult by             | N/A              | disabled      | Enable the associated channel to the right. Disabling this checkbox is the same as setting the channel to                                                 |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|              | unpremult        | none          | <p>The image is divided by this channel before being processed, and multiplied again afterwards.</p> <p>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate adjusting the contrast before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.</p> <p>If you are using unpremultiplied input images, you should leave this set to <b>none</b>.</p> |
| invert       | invert_unpremult | disabled      | Invert the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| mix          | mix              | 1             | Dissolve between the original image at 0 and the full effect at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# Sampler

This node converts a horizontal scanline of pixel data into a lookup curve. The Viewer **sampler** widget or **sampler y** coordinate selects the scanline (**sampler x** is ignored).

The Sampler node can be useful for visualizing the effects of color corrections on the image.

## Inputs and Controls

| Connection Type | Connection Name | Function                                           |
|-----------------|-----------------|----------------------------------------------------|
| Input           | unnamed         | The image sequence from which the sample is taken. |

| Control (UI)         | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                    |

| Sampler Tab          |                  |               |                                                                                                                                                                                                                                                                             |
| channels             | channels         | rgb           | <p>Lookup curves are only generated for these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p>                                                                |
| sampler xy           | sampler          | 0, 0          | <p>Sets the position of the sampler widget that determines the scanline to convert into a lookup curve.</p> <div>  <b>Note:</b> The <b>sampler x</b> coordinate is ignored.         </div> |
| normalize x          | normalize_x      | enabled       | When enabled, the lookup curves are normalized.                                                                                                                                                                                                                             |
| Sample current frame | sample_current   | N/A           | Click to sample the current frame and update the lookup curve output for the current sampler point.                                                                                                                                                                         |
| [lookup curves]      | lut              | N/A           | Displays the scanline specified by the <b>sampler y</b> coordinate as lookup curves. You can also view individual pixel values by mousing over the Viewer.                                                                                                                  |

# Saturation

For the times when you just want to correct an image's saturation (color intensity) and don't require limiting the correction to any particular range of hues, use the Saturation node.

If you do want to adjust the levels of saturation in a range of hues (for example, to diminish green, blue, or redscreen spill), use the [HueCorrect](#) node instead.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence whose saturation you want to adjust.                                                                                                                                                                                                                                                                                                                                |
|                 | mask            | <p>An optional image to use as a mask. By default, the saturation adjustment is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                          |
|----------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Saturation Tab |                  |               |                                                                                                                                                   |
| channels       | channels         | all           | <p>The saturation adjustment is only applied to these channels.</p> <p>You can use the checkboxes on the right to select individual channels.</p> |
| saturation     | saturation       | 1             | <p>Sets the saturation for the input image.</p> <p>A value of 1 equals no change. A value of 0 produces a grayscale image.</p>                    |
| mask           | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                     |
|                | maskChannelInput | none          | The channel to use as a mask. By default, the saturation adjustment is limited to the non-black areas of this channel.                            |
| inject         | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.      |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| invert         | invert_mask      | disabled      | Inverts the use of the mask channel so that the saturation adjustment is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| fringe         | fringe           | disabled      | <p>When enabled, only apply the effect to the edge of the mask.</p> <p>When disabled, the effect is applied to the entire mask.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                | unpremult        | none          | <p>The image is divided by this channel before being processed, and multiplied again afterwards.</p> <p>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate adjusting the saturation before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.</p> <p>If you are using unpremultiplied input images, you should leave this set to <b>none</b>.</p> |
| invert         | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| mix            | mix              | 1             | Dissolves between the original image at 0 and the full saturation adjustment at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

# SoftClip

Compresses high-dynamic-range (HDR) imagery into the 0-1 range. Because simple color compression changes the apparent chroma and contrast of the image, the **conversion** control allows for several compression modes that try to preserve colors.

## Inputs and Controls

| Connection Type | Connection Name | Function                                               |
|-----------------|-----------------|--------------------------------------------------------|
| Input           | unnamed         | The HDR image sequence to compress into the 0-1 range. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

# Toe

Toe lifts the black level, in a similar way to gain controls in other color correction nodes, but with a rolloff so that whites are mostly not affected. This makes the shadows in your image lighter.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence whose black levels you want to lift.                                                                                                                                                                                                                                                                                                                                  |
|                 | mask            | <p>An optional image to use as a mask. By default, the color correction is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled <b>mask</b>. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                     |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Toe Tab      |                  |               |                                                                                                                                              |
| channels     | channels         | rgb           | <p>The color correction is only applied to these channels.</p> <p>You can use the checkboxes on the right to select individual channels.</p> |
| lift         | lift             | 0             | Changes the black values to this value, without affecting any original white values of the image.                                            |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                |
|              | maskChannelInput | none          | The channel to use as a mask. By default, the color                                                                                          |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |               | correction is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| inject         | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| invert         | invert           | disabled      | Inverts the use of the mask channel so that the color correction is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| fringe         | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| (un)premult by | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to none.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                | unpremult        | none          | The image is divided by this channel before being processed, and multiplied again afterwards.<br><br>If you are using premultiplied input images, you may want to check <b>(un)premult by</b> and select <b>rgba.alpha</b> here. This will simulate applying the color correction before the premultiplication was done. It is the same as adding an Unpremult node before this node and a Premult node after, but allows you to work faster if you're only using one color correct node.<br><br>If you are using unpremultiplied input images, you should leave this set to <b>none</b> . |
| invert         | invert_unpremult | disabled      | Inverts the use of the (un)premultiply channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| mix            | mix              | 1             | Dissolves between the original image at 0 and the full color correction at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

# Truelight

FilmLight and Foundry have elected to no longer bundle Truelight as of Nuke 11. The Truelight node has been superseded by the free version of Baselight for Nuke which itself can import a BLG (Baselight Linked Grade) that can contain a Truelight strip, plus optionally a lot more in terms of creative grading intent. Together with OpenColorIO and the native Nuke Vectorfield node we feel all the Nuke color management issues for which the Truelight node was originally intended are now addressed.

For further information on Baselight for Nuke, please contact [plugin-support@filmlight.ltd.uk](mailto:plugin-support@filmlight.ltd.uk)

# Vectorfield

Vectorfield applies color values from lookup tables (LUTs), allowing you to make complex color corrections quickly using pre-calculated files. You can create LUT files using the [GenerateLUT](#) node or a third-party application capable of producing a LUT format the Vectorfield node supports.

For more information, see [CMSTestPattern](#) and [GenerateLUT](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                            |
|-----------------|-----------------|-----------------------------------------------------|
| Input           | unnamed         | The image sequence to receive the color correction. |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                             |
|------------------|------------------|---------------|--------------------------------------------------------------------------------------|
| Vectorfield Tab  |                  |               |                                                                                      |
| vectorfield file | vfield_file      | none          | The path and file name of the LUT file that describes the color correction to apply. |
| reload           | reload           | N/A           | Reloads the <b>vectorfield file</b> .                                                |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file type    | file_type        | auto          | <p>The file format of the LUT file to apply. The following file extensions are recognized:</p> <ul style="list-style-type: none"> <li>• <b>auto</b> - Nuke attempts to guess the file type from the <b>vectorfield file</b>'s extension.</li> <li>• <b>.3dl</b> - Autodesk and ASSIMILATE Scratch LUT format (3D).</li> <li>• <b>.blut</b> - Side Effects Houdini binary LUT format (3D).</li> <li>• <b>.cms</b> - Light Illusion LightSpace CMS LUT format (1D and 3D).</li> <li>• <b>.csp</b> - Rising Sun Research CineSpace LUT format (3D).</li> <li>• <b>.cub</b> - FilmLight Truelight LUT format (1D and 3D).</li> <li>• <b>.cube</b> - IRIDAS LUT format (1D and 3D).</li> <li>• <b>.vf</b> - Nuke's native LUT format used by the Vectorfield node (3D).</li> <li>• <b>.vfz</b> - Gzip compressed .vf files.</li> </ul> |

**Note:** FilmLight and Foundry have elected to no longer bundle Truelight as of Nuke 11. The Truelight node has been superseded by the free version of Baselight for Nuke which itself can import a BLG (Basilight Linked Grade) that can contain a Truelight strip, plus optionally a lot more in terms of creative grading intent. Together with OpenColorIO and the native Nuke Vectorfield node we feel all the Nuke color management issues for which the Truelight node was originally intended are now addressed.

# Filter Nodes

Filter nodes contain convolve filters, such as blur, sharpen, edge detect, and erode.

## Bilateral

A bilateral filter is a smoothing filter that is particularly good at preserving edges, though it can be computationally expensive.

### Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | guide           | <p>An optional image to compute color similarity while filtering.</p> <p>Connecting the <b>guide</b> input converts the output from the filter to the same format as the guide image, resulting in a joint bilateral resampling filter. If the source and <b>guide</b> images have the same format, the node acts as a cross bilateral filter.</p> <p>If the <b>guide</b> input is not connected, the output format is equal to that of the source input and acts as a standard bilateral filter.</p> |
|                 | mask            | <p>An optional image to use as a mask. By default, the filter effect is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p>                                                                                                                        |
|                 | unnamed         | The image sequence to filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Control (UI)         | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|------------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  |                  |               | If you set this to something other than <b>all</b> or <b>none</b> , you can use the checkboxes on the right to select individual channels.                                                                                                                                                                                                                                                                       |
| Guide Channels   | guide            | all           | <p>When the <b>guide</b> input is connected, sets the channels in the guide image used to compute the filtering weights.</p> <p>The guide image should contain some prior information on the source useful to the filtering, such as a <b>depth</b> channel. If no information is available, the result of an unguided C_Bilateral filter can be used as <b>guide</b> input of a second filtering operation.</p> |
| Size             | size             | 3             | Sets the height and width of the area within which pixels are compared to calculate the blur. Higher values widen the compare area, producing greater effect.                                                                                                                                                                                                                                                    |
| Positional Sigma | positionalSigma  | 0.4           | Controls the amount that nearby pixels affect the overall blur.                                                                                                                                                                                                                                                                                                                                                  |
| Colour Sigma     | colourSigma      | 0.4           | Controls the amount of blur that occurs over edges in the image, lower values preserve edges more reliably.                                                                                                                                                                                                                                                                                                      |
| Filter           | filter           | gaussian      | <p>Sets the type of color weighting applied to the output:</p> <ul style="list-style-type: none"> <li>• <b>gaussian</b> - weighted to differences in the surrounding pixel color and how close those pixels are to one another.</li> <li>• <b>median</b> - weighted according to the middle value pixel.</li> </ul>                                                                                              |
| Mask             | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                    |
|                  | maskChannelInput | none          | The channel to use as a mask. By default, the filter effect is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                                                                   |
| Inject           | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b>                                                                                                                                                                                                                                                                                                                                                     |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                     |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | channel. Injecting the mask allows you to use the same mask further downstream.                                              |
| Invert       | invert_mask      | disabled      | Inverts the use of the mask channel so that the filter effect is limited to the non-white areas of the mask.                 |
| Fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask. |
| Mix          | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                          |

# Blur

Adds blur to an image or matte using **box**, **triangle**, **quadratic**, or **gaussian** filter algorithms. The blur value is calculated for image pixels by examining their neighbors within the constraints of the **size** control (in pixels), and applying the selected algorithms. The default, **gaussian**, produces the smoothest blur, but takes longer to render.

You can also create this node by pressing **B** on the Node Graph.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to blur.                                                                                                                                                                                                                                                                                                                                                  |
|                 | mask            | <p>An optional image to use as a mask. By default, the blur effect is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                         |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Blur Tab     |                  |               |                                                                                                                                                                                                                                                                                                                                                                  |
| channels     | channels         | all           | <p>The blur effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p>                                                                                                                                                       |
| size         | size             | 0             | Sets the radius within which pixels are compared to calculate the blur. Higher values widen the compare area, producing more blur.                                                                                                                                                                                                                               |
| filter       | filter           | gaussian      | <p>Select the filter algorithm to use:</p> <ul style="list-style-type: none"> <li>• box</li> <li>• triangle</li> <li>• quadratic</li> <li>• gaussian</li> </ul> <div>  <b>Note:</b> Box blur is the fastest to render, whereas Gaussian blur is the smoothest.         </div> |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                |
|----------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| quality        | quality          | 15            | Controls the trade off between faster processing time at lower values, and smoothness at higher values.<br><br>The image is scaled down so the blur filter is no larger than this number, and then scaled up with linear interpolation after filtering. |
| crop to format | crop             | enabled       | When enabled, the bounding box cannot grow past its incoming size. This avoids creating oversized bounding boxes that can take longer to compute.                                                                                                       |
| mask           | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                           |
|                | maskChannelInput | none          | The channel to use as a mask. By default, the filter effect is limited to the non-black areas of this channel.                                                                                                                                          |
| inject         | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                            |
| invert         | invert_mask      | disabled      | Inverts the use of the mask channel so that the filter effect is limited to the non-white areas of the mask.                                                                                                                                            |
| fringe         | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.                                                                                                                                                                                            |
|                |                  |               | When disabled, the effect is applied to the entire mask.                                                                                                                                                                                                |
| mix            | mix              | 1             | Dissolves between the original image at 0 and the full blur effect at 1.                                                                                                                                                                                |

# Bokeh

Bokeh is a plug-in originally developed by Peregrine Labs and acquired by Foundry in 2022. Bokeh was introduced natively to Nuke 14.0v2 and Nuke 13.2v6, and later releases of Nuke, NukeX, Nuke Studio, Nuke Indie, and Nuke Non-commercial to all customers with active licenses.

Bokeh defocuses an image according to a Z depth map, Deep data, or Camera information. You can control where the focal plane lies to focus on specific elements in an image and simulate real-world lenses. You can also control the shape of the defocus kernel using the Kernel input.

**Note:** You can defocus an image without using any additional depth data, but the result is uniformly defocused by the **Multiplier** control.

**Note:** The native version of Bokeh is backward compatible with version 1.4.8 of the pgBokeh plug-in. For older Nuke scripts containing legacy pgBokeh nodes, the pgBokeh nodes are automatically remapped to the Nuke-native Bokeh node. If the old pgBokeh plugin is still present in the Nuke plugin path, we recommend you remove it to ensure the native Bokeh node is used by Nuke.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | Mattes          | <p>An optional input to use as a mask. By default, the effect is limited to the non-black areas of the mask.</p> <p>At first, the Mattes input appears as a triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the Mattes input, ensure that the <b>Default Matte Channel</b> control is disabled or set to <b>none</b>.</p> |
|                 | Deep Input      | An optional input to use Deep data as the depth channel.                                                                                                                                                                                                                                                                                                                                       |
|                 | Camera          | An optional input to use Camera node data to determine the focal plane.                                                                                                                                                                                                                                                                                                                        |
|                 | Kernel          | An optional input to control the shape of the defocus kernel. This input is only used when the <b>Kernel Type</b> is set to <b>Input</b> in the node properties.                                                                                                                                                                                                                               |
|                 | Input           | The image to which you want to apply the effect.                                                                                                                                                                                                                                                                                                                                               |

| Control (UI)   | Knob (Scripting) | Default Value   | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# BumpBoss

BumpBoss produces an emboss effect by overlaying input A over input B, rather than offsetting a single input image like the Emboss node. The BumpBoss properties can be modified by the offset between the **center** and **lightposition** indicators in the Viewer.

See also [Emboss](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | A               | The emboss texture to overlay input B.                                                                                                                                                                                                                                                                                                                                         |
|                 | B               | The image sequence to emboss with input A.                                                                                                                                                                                                                                                                                                                                     |
|                 | mask            | <p>An optional image to use as a mask. By default, the filter effect is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                     |
|-------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BumpBoss Tab      |                  |               |                                                                                                                                                                                                              |
| channels          | channels         | all           | <p>The emboss effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> |
| light position xy | lightposition    | 480, 360      | Sets the coordinates of the <b>lightposition</b> indicator in the Viewer. The position of this indicator in relation to the <b>center</b> indicator controls the shadow applied to                           |

| Control (UI)             | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          |                  |               | <p>the emboss.</p> <div>  <b>Note:</b> You can also move the <b>lightposition</b> indicator manually. </div>                                                                                                                                                                               |
| Bump Size                | bumpsize         | 1             | Sets the size of the emboss applied to the image connected to input <b>B</b> .                                                                                                                                                                                                                                                                                              |
| Light Height             | height           | 1             | <p>Controls the height of the <b>lightposition</b> indicator, where zero is level with the image, producing no emboss.</p> <p><b>Note:</b> Negative values position the light 'behind' the image.</p>                                                                                                                                                                       |
| Light Intensity          | intensity        | 1             | Sets the intensity of the simulated light.                                                                                                                                                                                                                                                                                                                                  |
| Minimum Shadow Intensity | minshadow        | 0             | Sets the minimum shadow intensity limit. Increasing this value decreases the amount of shadow allowed, and vice versa.                                                                                                                                                                                                                                                      |
| Image Center xy          | center           | 320, 240      | <p>Sets the coordinates of the <b>center</b> indicator in the Viewer. The position of the <b>lightposition</b> indicator in relation to this indicator controls the shadow applied to the emboss.</p> <div>  <b>Note:</b> You can also move the <b>center</b> indicator manually. </div> |
| mask                     | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                               |
|                          | maskChannelInput | none          | The channel to use as a mask. By default, the filter effect is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                              |
| inject                   | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b>                                                                                                                                                                                                                                                                                                                |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                     |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | channel. Injecting the mask allows you to use the same mask further downstream.                                              |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel so that the filter effect is limited to the non-white areas of the mask.                 |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask. |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                          |

# Convolv

Convolv lets you create custom filter effects by supplying your own filter image. This image is used as the convolution matrix. In other words, the new value of a pixel is calculated by centering the filter image on the pixel, examining its neighbors, multiplying each pixel value by the corresponding pixel values in the filter image, and then adding the results together. This allows you to defocus a clip and create lens blur effects in the shape of the filter image, for example.

See also [Blur](#) and [Defocus](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | filter          | The filter image. This image is used as the convolution matrix.<br><br>Note that you don't necessarily need to crop the filter image to a smaller size, as Fast Fourier Transforms are used to speed up |

| filter bounds        | filter_bounds      | shape         | <p>Sets what to use as the filter bounds:</p> <ul style="list-style-type: none"> <li>• <b>shape</b> - The <b>filter</b> input's bounding box. In this case, Convolve only uses the bounding box area, and the center of the filter is the center of the bounding box. This is the default value, and you may want to use it if your <b>filter</b> input is a roto shape with a small bounding box that doesn't fill the entire format area, for example.</li> </ul>                                                                                                                                                    |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                             |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | <ul style="list-style-type: none"> <li>• <b>format</b> - The <b>filter</b> input's format. In this case, Convolve uses the entire format area, allowing you to offset the filter image within the format.</li> </ul> |
| normalize    | normalize        | enabled       | When enabled, the <b>filter</b> input is divided by the sum of all the pixels in it before using it. This ensures that the convolution doesn't change the overall brightness.                                        |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                        |
|              | maskChannelInput | none          | <p>The channel to use as a mask. By default, the filter effect is limited to the non-black areas of this channel.</p> <p>For example, you can use a depth channel here to simulate depth-of-field blurring.</p>      |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                         |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel so that the filter effect is limited to the non-white areas of the mask.                                                                                                         |
| fringe       | fringe           | disabled      | <p>When enabled, only apply the effect to the edge of the mask.</p> <p>When disabled, the effect is applied to the entire mask.</p>                                                                                  |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full filter effect at 1.                                                                                                                                           |

# Defocus

Defocuses the image using a disc filter. This allows you to simulate the defocusing effect of a circular lens and create lens blur effects like 'bokeh' (the blooming of highlights when defocused).

To create lens blur effects that aren't circular, use the [Convolve](#) node.

To simply blur an image or a matte, use the [Blur](#) node, which is faster than Defocus.

## Inputs and Controls

| Connection Type | Connection Name | Function                       |
|-----------------|-----------------|--------------------------------|
| Input           | unnamed         | The image sequence to defocus. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                |
|--------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| channels     | channels         | all           | The defocus effect is only applied to these channels.<br><br>If you set this to something other than <b>all</b> or <b>none</b> , you can use the checkboxes on the right to select individual channels. |
| defocus      | defocus          | 1             | Sets the size of the defocus disc used.                                                                                                                                                                 |
| aspect ratio | ratio            | 1             | Adjusts the width of the defocus disc without altering its height.                                                                                                                                      |
| scaling      | scale            | 1             | Scales the defocus disc simultaneously on the x and y axes. You can also split the scaling into separate width and height controls.                                                                     |
| quality      | quality          | 20            | Sets the interpolation used to smooth out the discs. Higher values produce better results, but take longer to render.                                                                                   |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| method       | method           | accelerated   | <p>Sets the mode of operation:</p> <ul style="list-style-type: none"> <li>• <b>accelerated</b> - faster than <b>fullprecision</b> mode, especially for large defocus disks.</li> <li>• <b>fullprecision</b> - delivers perfect defocus at the cost of performance.</li> </ul> <div>  <b>Note:</b> Accelerated mode may generate speckles in horizontal lines due to imprecisions in the computer math. Normally, those speckles are invisible to the eye (<math>\delta &lt; 0.00001</math>), but they can cause artifacts in nodes that use comparison math (that is, if <math>(src.red == 0)</math> ...). You can use <b>fullprecision</b> to avoid this speckling, but there is a significant render time increase. </div> |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|              | maskChannelInput | none          | The channel to use as a mask. By default, the filter effect is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel so that the filter effect is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| fringe       | fringe           | disabled      | <p>When enabled, only apply the effect to the edge of the mask.</p> <p>When disabled, the effect is applied to the entire mask.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

# DegrainBlue

This gizmo reduces grain in the blue channel, which often is where most grain occurs.

## Inputs and Controls

| Connection Type | Connection Name | Function                       |
|-----------------|-----------------|--------------------------------|
| Input           | unnamed         | The image sequence to degrain. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                        |
|--------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------|
| User Tab     |                  |               |                                                                                                                                 |
| Size         | size             | 8             | The amount of grain to remove from the blue channel. Increasing this value removes more grain and decreasing it leaves more in. |

# DegrainSimple

Lets you reduce grain in the red, green, and blue channels respectively, and allows you to mask the effect.

| DegrainSimple Tab |                  |               |                                                                                                                                                                                                                                         |
| channels          | channels         | all           | The channels to de grain. If you set this to something other than <b>all</b> , <b>rgba</b> , or <b>rgb</b> , the <b>R blur</b> , <b>G blur</b> , and <b>B blur</b> sliders below affect the first three channels in the selected layer. |
| R blur            | rVal             | 2             | The amount of grain to remove from the red channel.                                                                                                                                                                                     |
| G blur            | gVal             | 2             | The amount of grain to remove from the green channel.                                                                                                                                                                                   |
| B blur            | bVal             | 5             | The amount of grain to remove from the blue channel, which often is where most grain occurs.                                                                                                                                            |
| mask              | N/A              | disabled      | Enable the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                            |
|                   | maskChannelInput | none          | The channel to use as a mask. By default, the grain reduction is limited to the non-black areas of this channel.                                                                                                                        |
| inject            | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                            |
| invert            | invert_mask      | disabled      | Inverts the use of the mask channel so that the grain                                                                                                                                                                                   |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                     |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | reduction is limited to the non-white areas of the mask.                                                                     |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask. |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full grain reduction at 1.                                                 |

# Denoise

The Denoise node is an efficient tool for removing noise or grain from your footage. It uses spatial or temporal filtering to remove noise without losing image quality.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                             |
|-----------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | Motion          | An optional input for attaching pre-calculated motion vectors, such as those created by VectorGenerator.<br><br>Denoise can generate motion vectors internally, but connecting this input may produce significantly faster results.                                  |
|                 | Noise           | An optional input for attaching a separate noise file. If you're working with complex footage that doesn't have a convenient area for analyzing noise, you can use the <b>Noise</b> input to analyze noise from another image and apply the results to your footage. |
|                 | Source          | The image sequence to denoise.                                                                                                                                                                                                                                       |

| Control (UI)         | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|              |                  |               | information on the GPUs supported by your operating system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Source       | type             | Digital       | Choose <b>Film</b> or <b>Digital</b> according to what type of footage you're working with.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Noise Model  | model            | Modulated     | Choose what type of noise you're dealing with: <ul style="list-style-type: none"> <li>• <b>Constant</b> - try this if you're working on film footage with lots of detail and not too much noise in dark regions, or digital footage with lots of detail and not too much noise in light regions.</li> <li>• <b>Modulated</b> - for most cases, this is a good option.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Lift Blacks  | lift_blacks      | disabled      | When enabled, blacks in the image are lifted toward white. This can be particularly useful if your image contains a lot of sub-blacks, areas of black with a value less than 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Profile      | profile          | Constant      | Choose the denoise profile to use: <ul style="list-style-type: none"> <li>• <b>Constant</b> - let Denoise look at the analysis region and remove the same amount of noise across all intensities. <b>Constant</b> is nearly always a good choice, but if you find that your denoise results are too smooth and adjusting <b>DenoiseAmount</b> and <b>RollOff</b> doesn't help, you should try setting this to <b>Automatic</b>.</li> <li>• <b>Automatic</b> - let Denoise estimate a noise profile automatically based on the entire <b>ProfileFrame</b>. This way, Denoise removes different amounts of noise from the shadow, midtone, and highlight areas of the <b>Source</b> image. When you first switch to automatic profiling, Denoise uses the current frame to calculate the profile. If you'd like to use a different frame, you need to set <b>Profile Frame</b> on the <b>Profile</b> tab to that frame and click the <b>Recalculate Profile</b> button.</li> </ul> |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |               | <p>Denoise always bases the noise profile on your <b>Source</b> footage, even if you've attached another clip to the <b>Noise</b> input.</p> <p>You can use the <b>TuneProfile</b> controls to tweak both <b>Constant</b> and <b>Automatic</b> profiles.</p>                                                                                                                                                                                                                                         |
| Output         | output           | Result        | <p>Whether to output the denoised image or the noise that was removed:</p> <ul style="list-style-type: none"> <li>• <b>Result</b> - output the denoised <b>Source</b> image.</li> <li>• <b>Noise</b> - output the noise that was removed from the <b>Source</b> image. Only noise should be visible in this image. If you can see a lot of picture detail, it means the current settings are making Denoise work too hard and remove too much of the image, which leads to a soft result.</li> </ul> |
| Denoise Amount | amount           | 1             | Sets the overall amount of noise to remove. Increase this to remove more noise, or decrease to keep more detail. A value of 0 removes no noise.                                                                                                                                                                                                                                                                                                                                                      |
| Roll Off       | rolloff          | 2             | <p>Sets the smoothness of the denoise thresholding.</p> <p>A value of 1 equals hard thresholding. Any other value produces soft thresholding between the <b>Denoise Amount</b> and the <b>Roll Off</b> multiplied by <b>Denoise Amount</b>.</p>                                                                                                                                                                                                                                                      |
| Smoothness     | smoothness       | 1             | Sets the smoothness of the denoised image. This affects the underlying image rather than the noise detected.                                                                                                                                                                                                                                                                                                                                                                                         |

| Control (UI)        | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     |                  |               | In most cases, the default value of 1 works fine. However, you can try using this control if you're not getting the correct smoothness level by adjusting the <b>Denoise Amount</b> .                                                                                                                                                                                                                                                                                                                                                                        |
| Luminance Blend     | lumablend        | 0.7           | <p>Blends the denoised luminance with the image's original luminance, bringing back some of the image detail in the result.</p> <p>You might want to have this set to 1 when you're working on denoising the footage, but for the final result, you'll want to decrease it.</p>                                                                                                                                                                                                                                                                              |
| Preserve Edges      | preserve_edges   | disabled      | When enabled, Denoise attempts to sharpen the image at edges to prevent over-smoothing, though this can emphasize noise in some cases.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Temporal Processing |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Enable              | enable_temporal  | disabled      | <p>When enabled, uses frames either side of the current frame to perform temporal frame blending, which may produce a better denoise result.</p> <div>  <b>Note:</b> The <b>Motion</b> input must be connected to enable <b>Temporal Processing</b>. </div> <p>The number of frames used either side of the current frame is determined by the <b>Temporal Frame Offset</b> control.</p> <p>When disabled, uses only the current frame to produce the denoise result.</p> |
| Frame Blending      | frame_blending   | 0.1           | Sets the variance allowed between regions in blended frames. Higher values attempt to blend more regions, but can lose image detail.                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Control (UI)        | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|---------------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| High Gain           | highGain         | 1             | <p>Scales the denoising threshold in the highlight areas of the <b>Source</b> image. For example, a value of <b>2</b> multiplies the threshold by 2. Everything below the threshold is considered noise and removed, while everything above the threshold is kept.</p> <p>This control is only available when <b>Tune Profile</b> is enabled.</p> |
| Profile Frame       | profileFrame     | 1             | <p>The frame at which to estimate the noise profile when <b>Profile</b> is set to <b>Automatic</b>.</p> <p>This control is read only. If you want to change the profile frame, you need to scrub to a new frame in the Viewer and click <b>Recalculate Profile</b>.</p>                                                                           |
| Recalculate Profile | reprofile        | N/A           | <p>If you've set <b>Profile</b> to <b>Automatic</b>, Denoise first uses the current frame to calculate the profile. If you'd like to use a different frame, you need to scrub to that frame and click this button.</p>                                                                                                                            |

# DirBlur

This node applies three types of directional blur to the input image: **zoom**, **radial**, and **linear**.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to receive the blur effect.                                                                                                                                                                                                                                                                                                                               |
|                 | mask            | <p>An optional image to use as a mask. By default, the blur effect is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)       | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DirBlurWrapper Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| channels           | channels         | all           | The blur effect is only applied to these channels. You should leave this set to <b>all</b> and select the channels you want to blur using <b>BlurLayer</b> .                                                                                                                                                                                                                                                                                                                                                    |
| BlurType           | BlurType         | zoom          | <p>Select the blur type to apply:</p> <ul style="list-style-type: none"> <li>• <b>zoom</b> - smears pixels in all directions from a center point. You can use this to simulate light rays, or to transition between one clip and another.</li> <li>• <b>radial</b> - smears pixels around a center point. You can use this to simulate motion blur on a rotating object.</li> <li>• <b>linear</b> - smears pixels in a given direction. You can use this to simulate motion blur on a moving object.</li> </ul> |
| BlurLayer          | BlurLayer        | rgb           | <p>The blur effect is only applied to these channels. This control works together with the <b>channels</b> control. For a channel to be blurred, it needs to be selected from both the <b>channels</b> and the <b>BlurLayer</b> dropdown menu.</p> <p>You can use the checkboxes on the right to select</p>                                                                                                                                                                                                     |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                  |
|------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  |                  |               | individual channels.                                                                                                                                                                                                                                                                      |
| Holdout Channel  | N/A              | disabled      | <p>Enables the associated holdout channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b>.</p> <p>This control only has an effect when <b>BlurType</b> is set to <b>zoom</b>.</p>                                                                 |
|                  | holdout          | none          | <p>Pixels corresponding to non-black pixels in the holdout channel are NOT averaged into the final pixel value.</p> <p>This control only has an effect when <b>BlurType</b> is set to <b>zoom</b>.</p>                                                                                    |
| BlurCenter xy    | BlurCenter       | 320, 240      | <p>Sets the blur origin or center on the xy axes, or drag the <b>BlurCenter</b> handle in the Viewer.</p> <p>When using <b>linear</b> blur, <b>BlurCenter</b> only has an effect if <b>UseTarget</b> is enabled.</p>                                                                      |
| BlurLength       | BlurLength       | 5             | <p>The length (in pixels) of the blur applied.</p> <p>When using <b>zoom</b> blur, negative values reverse the blur direction.</p>                                                                                                                                                        |
| BlurAngle        | BlurAngle        | 45            | Determines the direction of <b>linear</b> blur when <b>UseTarget</b> is disabled.                                                                                                                                                                                                         |
| Linear Target xy | target           | 480, 240      | <p>When using <b>linear</b> blur with <b>UseTarget</b> enabled, a vector is created between this and <b>BlurCenter</b>. This vector then determines the direction of linear blur.</p> <p>You can also adjust <b>Linear Target</b> by dragging the <b>target</b> handle in the Viewer.</p> |
| UseTarget        | UseTarget        | disabled      | When enabled, the direction of <b>linear</b> blur is determined by a vector between <b>BlurCenter</b> and <b>Blur</b>                                                                                                                                                                     |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                             |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | <b>Target.</b><br>If this is disabled, the direction of <b>linear</b> blur is determined by <b>Blur Angle</b> .                                      |
| Samples      | Samples          | 1             | The number of samples. You can increase this value for smoother blur, but note that it takes much longer to render.                                  |
| PixelAspect  | PixelAspect      | 1             | Pixel aspect ratio. If you're working on non-square pixel or anamorphic footage, you need to set this value correctly to avoid unwanted distortions. |
| Quality      | Quality          | 1             | The scaling factor of the blur. The minimum value is 1 and produces the highest quality.                                                             |
| Pixel Offset | pixeloffset      | 0             | When <b>BlurType</b> is set to <b>zoom</b> , lets you offset pixels along the direction of the blur.                                                 |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                        |
|              | maskChannelInput | none          | The channel to use as a mask. By default, the blur is limited to the non-black areas of this channel.                                                |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.         |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel so that the blur is limited to the non-white areas of the mask.                                                  |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask.                         |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full blur effect at 1.                                                                             |

# DropShadow

This gizmo creates a drop shadow for any input image that has an alpha channel with values greater than 0.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                |
|-----------------|-----------------|-------------------------------------------------------------------------|
| Input           | input           | The input image from which shadows are cast.                            |
|                 | bg              | The background image to merge over using the specified merge operation. |

| Control (UI)        | Knob (Scripting)         | Default Value | Function                                                                                                                                                                                 |
|---------------------|--------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Tab            |                          |               |                                                                                                                                                                                          |
| enable drop shadow  | enable_dropshadow_effect | enabled       | When enabled, the drop shadow effect is applied.                                                                                                                                         |
| inherit input color | inherit_input_color      | disabled      | When enabled, the drop shadow uses the input color as the shadow and ignores the <b>color</b> control.<br><br>When disabled, the shadow color is determined by the <b>color</b> control. |
| color               | color                    | 0, 0, 0       | When <b>inherit input color</b> is disabled, controls the color used for the drop shadow effect.                                                                                         |
| opacity             | opacity                  | 0.7           | Controls the opacity of the shadow effect.                                                                                                                                               |
| angle               | dropshadow_angle         | 225           | Controls the direction in which the shadow is cast, where 0/360° is equal to left and 180° is right.                                                                                     |

| Control (UI)  | Knob (Scripting)    | Default Value | Function                                                                                                                                             |
|---------------|---------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| distance      | dropshadow_distance | 5             | Determines the distance from the input that the shadow falls, in pixels.                                                                             |
| softness      | softness            | 0             | Controls how much blur/feather is applied to the shadow effect.                                                                                      |
| shrink/expand | size                | 0             | Controls the size of the effect by eroding (negative values) or dilating (positive values) the shadow.                                               |
| input         | operation           | over          | <p>Sets the merge operation used when comping the input over the background.</p> <p>See Nuke's <a href="#">online help</a> for more information.</p> |

# EdgeBlur

Blurs detected edges within the matte specified in the matte channel.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to blur.                                                                                                                                                                                                                                                                                                                                                  |
|                 | mask            | <p>An optional image to use as a mask. By default, the blur effect is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EdgeBlur Tab   |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                  |
| channels       | channels         | all           | <p>The blur effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p>                                                                                                                                                                                       |
| matte input    | N/A              | enabled       | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                    |
|                | control channel  | rgba.alpha    | Sets the channel containing the alpha used to detect the edges.                                                                                                                                                                                                                                                                                                                                  |
| size           | size             | 3             | Sets the size of the blur applied to the detected edges.                                                                                                                                                                                                                                                                                                                                         |
| filter         | filter           | gaussian      | <p>Select the filter algorithm to use:</p> <ul style="list-style-type: none"> <li>• box</li> <li>• triangle</li> <li>• quadratic</li> <li>• gaussian</li> </ul> <div>  <b>Note:</b> Box is the fastest to render, whereas Gaussian blur is the smoothest.         </div>                                      |
| quality        | quality          | 15            | <p>Sets the quality of the applied filter. Lower values produce faster renders at the expense of smoothness, and vice-versa.</p> <div>  <b>Note:</b> The image is scaled down so the blur filter is no larger than this number, and then scaled up using linear interpolation after filtering.         </div> |
| crop to format | crop             | enabled       | When enabled, if the bounding box equal to or less than the format, don't enlarge it past the format. This                                                                                                                                                                                                                                                                                       |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                     |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | avoids creating oversized images that you don't use.                                                                                         |
| edge mult    | edge_mult        | 2             | Controls the sharpness of the edge blur. Lower values produce sharper edges and vice versa.                                                  |
| tint         | tint             | 1             | Sets the multiplier for the rgb channels in the edge blur.                                                                                   |
| brightness   | brightness       | 1             | Sets the multiplier for all channels in the edge blur.                                                                                       |
| output       | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                |
|              | output           | none          | Sets the output channel for any blur applied.                                                                                                |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                |
|              | maskChannelInput | none          | The channel to use as a mask. By default, the blur is limited to the non-black areas of this channel.                                        |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream. |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel so that the blur is limited to the non-white areas of the mask.                                          |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.                                                                                 |
|              |                  |               | When disabled, the effect is applied to the entire mask.                                                                                     |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full blur effect at 1.                                                                     |

# EdgeDetect

A basic edge detection node with options for a blur before the edge detection and an erode after.

## Inputs and Controls

| Connection Type | Connection Name | Function                               |
|-----------------|-----------------|----------------------------------------|
| Input           | unnamed         | The image sequence to detect edges in. |

| Control (UI)          | Knob (Scripting) | Default Value | Function                                                                                                                                                                                        |
|-----------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EdgeDetectWrapper Tab |                  |               |                                                                                                                                                                                                 |
| Edge Detector         | edgedetector     | sobel         | Choose an edge detection method: <ul style="list-style-type: none"> <li>• simple</li> <li>• sobel</li> <li>• prewitt</li> </ul>                                                                 |
| channels              | channels         | all           | The effect is only applied to these channels.<br><br>If you set this to something other than <b>all</b> or <b>none</b> , you can use the checkboxes on the right to select individual channels. |
| Threshold             | threshold        | 0             |                                                                                                                                                                                                 |
| output                | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                   |
|                       | output           | none          | Sets the output channel for the edge detect applied.                                                                                                                                            |
| mask                  | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                   |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                             |
|-------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   | maskedgedetect   | none          | The channel to use as a mask. By default, the blur is limited to the non-black areas of this channel.                                                                                                                                |
| PreBlur/PostErode |                  |               |                                                                                                                                                                                                                                      |
| Erode size        | erodesize        | 0             |                                                                                                                                                                                                                                      |
| Blur size         | blursize         | 0             | Lower numbers make the calculations faster but the result might not be as smooth. The image size is scaled down so that the blur filter is no larger than this number, and then scaled up with linear interpolation after filtering. |
| Blur quality      | blurquality      | 15            | Set the blur quality. The lower the number, the faster the calculation.                                                                                                                                                              |

# EdgeExtend

EdgeExtend allows you to correct unpremultiplied foreground color at the edge of soft mattes by eroding or dilating the sample region, pulling pixels from deeper inside or outside your matte. The algorithm behind the node works independent of the size of the fill regions you are trying to extend. You can also output and edge mask to allow you to work on the edges separate from the rest of the image. A typical use case might be adjusting a matte to account for motion blur.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                             |
|-----------------|-----------------|--------------------------------------------------------------------------------------|
| Input           | Matte           | Controls which areas of the image are affected using the alpha channel or luminance. |
|                 | Source          | The image sequence to which the effect is applied.                                   |

| Control (UI)         | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Source Is Premultiplied | sourceIsPremultiplied | disabled      | <p>When enabled, EdgeExtend assumes that the image connected to the <b>Source</b> input is premultiplied.</p> <p>When disabled, no premultiplication is assumed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Erode                   | erode                 | 0             | Controls the amount of erosion or dilation applied to the Matte area. Negative values dilate the matte and positive values erode the matte.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Detail Amount           | detailAmount          | 1             | Controls how much of the original high frequency detail and noise is recovered after eroding or dilating the matte region.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                             |
|--------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Output       |                  |               |                                                                                                                                                                                      |
| Edge Mask    | edgeMaskChannel  | disabled      | When enabled, output an edge mask to the selected channel. This allows you to work on the mask separately to the rest of the image and then merge the result back into the pipeline. |
| Premultiply  | premultiply      | enabled       | When enabled, EdgeExtend premultiplies the output image.<br><br>When disabled, no premultiplication is applied.                                                                      |

# Emboss

Produces an emboss effect by offsetting the original input using the **Angle** and **Width** controls, rather than overlaying a second input like the BumpBoss node.

See also [BumpBoss](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input           | unnamed         | The image sequence to emboss.                                                                                                                                                                                                                                                                                                                                                |
|                 | mask            | <p>An optional image to use as a mask. By default, the blur effect is limited to the non-black areas of the mask.</p> <p>At first, the mask input appears as triangle on the right side of the node, but when you drag it, it turns into an arrow labeled mask. If you cannot see the mask input, ensure that the <b>mask</b> control is disabled or set to <b>none</b>.</p> |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                           |
|---------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Emboss Tab    |                  |               |                                                                                                                                                                                                                                                                                    |
| channels      | channels         | all           | <p>The effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p>                                                                              |
| Emboss Type   | optype           | traditional   | <p>Sets the type of emboss output you want:</p> <ul style="list-style-type: none"> <li>• <b>traditional</b> - applies the emboss effect to the input image.</li> <li>• <b>effect</b> - outputs the effect only, making it easy for you to composite with other footage.</li> </ul> |
| Angle         | Angle            | 0             | Sets the angle of the emboss effect in degrees.                                                                                                                                                                                                                                    |
| Width         | Width            | 1             | Set the width of the emboss outlines. A low value gives a more subtle, finely detailed result.                                                                                                                                                                                     |
| mask          | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                      |
|               | maskedgedetect   | none          | The channel to use as a mask. By default, the effect is limited to the non-black areas of this channel.                                                                                                                                                                            |
| Edge Detector | edgedetector     | sobel         | <p>Choose an edge detection method:</p> <ul style="list-style-type: none"> <li>• simple</li> <li>• sobel</li> <li>• prewitt</li> </ul>                                                                                                                                             |
| edgechannels  | edgechannels     | rgb           | <p>The edge detection is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p>                                                                      |
| Threshold     | threshold        | 0             |                                                                                                                                                                                                                                                                                    |
| output        | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the                                                                                                                                                                               |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                               |
|-------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   |                  |               | channel to <b>none</b> .                                                                                                                                                                                                                               |
|                   | output           | none          | Sets the output channel for the edge detect applied.                                                                                                                                                                                                   |
| mask              | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                          |
|                   | maskedgedetect   | none          | The channel to use as a mask. By default, the effect is limited to the non-black areas of this channel.                                                                                                                                                |
| PreBlur/PostErode |                  |               |                                                                                                                                                                                                                                                        |
| Erode size        | erodesize        | 0             |                                                                                                                                                                                                                                                        |
| Blur size         | blursize         | 0             | Set the blur size. Lower values make the calculations faster but the result might not be as smooth. The image size is scaled down so that the blur filter is no larger than this number, and then scaled up with linear interpolation after filtering. |
| Blur quality      | blurquality      | 15            | Set the blur quality. The lower the number, the faster the calculation.                                                                                                                                                                                |
| mask              | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                          |
|                   | maskedgedetect   | none          | The channel to use as a mask. By default, the effect is limited to the non-black areas of this channel.                                                                                                                                                |
| inject            | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                           |
| invert            | invert_mask      | disabled      | Inverts the use of the mask channel so that the effect is limited to the non-white areas of the mask.                                                                                                                                                  |
| fringe            | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire                                                                                                                                 |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                            |
|--------------|------------------|---------------|---------------------------------------------------------------------|
|              |                  |               | mask.                                                               |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1. |

# Erode (blur)

Similar to [Erode \(filter\)](#), but smoother, input pixels are filtered relative to the **size** control. Negative values cause brighter areas to expand into darker areas and positive values cause darker areas to expand into lighter areas - particularly useful with mattes. Additionally, you can add blur to the input using the **blur** and **quality** controls.

**Note:** Solid areas of any color other than 0 or 1 change their color as they are treated as the anti-aliased edge. This can be corrected by using a different algorithm, such as the [Erode \(filter\)](#) node.

## Inputs and Controls

| Connection Type | Connection Name | Function                          |
|-----------------|-----------------|-----------------------------------|
| Input           | unnamed         | The image or matte to erode/blur. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                              |
|--------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| channels     | channels         | none          | <p>The effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                        |
|--------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| size         | size             | -1            | Adjusts the size of pixels within the channel defined by the <b>channels</b> control. Negative values increase the light pixels and vice versa. |
| blur         | blur             | 0             | Blurs the edges of the generated mask.                                                                                                          |
| quality      | quality          | 15            | Quality of the initial blur. Smaller values take less time to process.                                                                          |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                   |
|              | maskChannelInput | none          | The channel to use as a mask. By default, the effect is limited to the non-black areas of this channel.                                         |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.    |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel, so that the effect is limited to the non-white areas of the mask.                                          |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.                                                                                    |
|              |                  |               | When disabled, the effect is applied to the entire mask.                                                                                        |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                                             |

## Erode (fast)

Also known as the Dilate node, Erode (fast) controls the relative amount of dark (negative **size** values) and light (positive **size** values) pixels in the input. This can be used to grow or shrink mattes, for example, an alpha matte's pixels can be given a positive **size** value to cover more area.

Erode (fast) is similar to [Erode \(filter\)](#), but computationally less expensive.

## Inputs and Controls

| Connection Type | Connection Name | Function                     |
|-----------------|-----------------|------------------------------|
| Input           | unnamed         | The image or matte to erode. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                              |

| Dilate Tab   |                  |               |                                                                                                                                                                                                       |
| channels     | channels         | all           | <p>The effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> |
| size         | size             | 0             | Adjusts the size of pixels within the channel defined by the <b>channels</b> control. Positive values increase the light pixels and vice versa.                                                       |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                         |
|              | maskChannelInput | none          | The channel to use as a mask. By default, the effect is limited to the non-black areas of this channel.                                                                                               |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                          |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel, so that the effect is limited to the non-white areas of the mask.                                                                                                |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.                                                                                                                                          |
|              |                  |               | When disabled, the effect is applied to the entire mask.                                                                                                                                              |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                                                                                                   |

# Erode (filter)

Filters input pixels relative to the **size** control, and is particularly useful with mattes. Negative values cause brighter areas to expand into darker areas and positive values cause darker areas to expand into lighter areas. Use the **filter** dropdown to control the erode computation speed (**box**) versus quality (**gaussian**).

Erode (filter) is similar to [Erode \(fast\)](#), but can be computationally more expensive because you can select the filter type to improve the erode quality.

## Inputs and Controls

| Connection Type | Connection Name | Function                     |
|-----------------|-----------------|------------------------------|
| Input           | unnamed         | The image or matte to erode. |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                              |

|               | W                | none          |                                                                                                                                                                                         |
| non linear    | nonlinear        | disabled      |                                                                                                                                                                                         |
| effect only   | effect_only      | disabled      | When enabled, only the effect is passed downstream allowing you to use the effect on other footage.                                                                                     |
| size          | size             | 15            | Adjusts the size of pixels within the channels defined by the <b>channels</b> control. Values less than 15 increase the dark pixels and vice versa.                                     |
| filter        | filter           | gaussian      | <p>Sets the filter algorithm to use:</p> <ul style="list-style-type: none"> <li>• box</li> <li>• triangle</li> </ul>                                                                    |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |               | <ul style="list-style-type: none"> <li>• quadratic</li> <li>• gaussian</li> </ul> <div>  <b>Note:</b> Box is the fastest to render, whereas Gaussian blur is the smoothest.         </div>                                                                                                               |
| n/a            | quality          | 15            | <p>Sets the quality of blur to apply. The image is scaled down, so that the blur filter is no larger than this number, and then scaled up using linear interpolation after filtering.</p> <div>  <b>Note:</b> Lower quality values process more quickly, but the result is not as smooth.         </div> |
| crop to format | crop             | enabled       | When enabled, if the bounding box is at or inside the format, don't enlarge the effect past the format. This avoids creating oversized images that aren't used.                                                                                                                                                                                                                           |
| mask           | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                             |
|                | maskChannelInput | none          | The channel to use as a mask. By default, the effect is limited to the non-black areas of this channel.                                                                                                                                                                                                                                                                                   |
| inject         | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                                                                                              |
| invert         | invert_mask      | disabled      | Inverts the use of the mask channel, so that the effect is limited to the non-white areas of the mask.                                                                                                                                                                                                                                                                                    |
| fringe         | fringe           | disabled      | <p>When enabled, only apply the effect to the edge of the mask.</p> <p>When disabled, the effect is applied to the entire mask.</p>                                                                                                                                                                                                                                                       |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                            |
|--------------|------------------|---------------|---------------------------------------------------------------------|
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1. |

# GodRays

Averages together many samples of the image between its initial position and the **translate** and **center** indicators in the Viewer to produce lighting and blur effects.

- The **translate** indicator controls the direction of the rays created.
- The **center** indicator controls the center point for **rotate**, **scale**, and **skew** functions to produce motion blur.
- Add color and gamma changes, or use a mask input to control the output.

**Note:** Currently **translate** and **skew** do not correctly merge with other controls, such as **scale** - they must be done individually.

## Inputs and Controls

| Connection Type | Connection Name | Function                                               |
|-----------------|-----------------|--------------------------------------------------------|
| Input           | unnamed         | The image sequence to which you want to apply godrays. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                         |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Godrays Tab  |                  |               |                                                                                                                                                                                  |
| channels     | channels         | none          | <p>The effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select</p> |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                  |
|--------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | individual channels.                                                                                                                                                                                                                                      |
| translate xy | translate        | 0,0           | <p>Sets the position of the <b>translate</b> widget in the Viewer which controls the direction of the rays or blur.</p> <p>Straight-line motion blur can be simulated by positioning the translate widget along the direction of motion.</p>              |
| rotate       | rotate           | 0             | <p>Controls the direction of rotational rays or blur in relation to the <b>center</b> widget. Negative values produce clockwise rotation and vice versa.</p> <p>You can also use this in conjunction with the <b>scale</b> control to create spirals.</p> |
| scale        | scale            | 1             | <p>Controls the direction of zoom in relation to the <b>center</b> widget. Values less than one zoom out and vice versa.</p> <p>You can also use this in conjunction with the <b>rotate</b> control to create spirals.</p>                                |
| skew         | skew             | 0             | Controls the direction of skew in relation to the <b>center</b> widget                                                                                                                                                                                    |
| center       | center           | 1024, 778     | Sets the coordinates for the <b>center</b> widget in the Viewer. This is the center for <b>rotation</b> , <b>scale</b> , and <b>skew</b> .                                                                                                                |
| from color   | from_color       | 1             | Sets the color by which the initial image is multiplied.                                                                                                                                                                                                  |
| to color     | to_color         | 1             | Sets the color by which the final image is multiplied.                                                                                                                                                                                                    |
| gamma        | gamma            | 1             | Sets the gamma space in which colors are interpolated.                                                                                                                                                                                                    |
| steps        | steps            | 5             | Sets the number of steps used to create the rays. The more steps you use and the shorter, and therefore smoother, the rays appear.                                                                                                                        |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                     |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| max          | max              | disabled      | When enabled, only the brightest result of each image is output rather than the average.                                                     |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                |
|              | maskChannelInput | none          | The channel to use as a mask. By default, the effect is limited to the non-black areas of this channel.                                      |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream. |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel, so that the effect is limited to the non-white areas of the mask.                                       |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.                                                                                 |
|              |                  |               | When disabled, the effect is applied to the entire mask.                                                                                     |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                                          |

# Inpaint

Nuke's Inpaint is a time saving node for removing unwanted elements, such as tracking markers, blemishes, or wires. Inpaint uses surrounding pixels to fill an area marked in the alpha channel of the source image or **Matte** input. The **Stretch** controls bias the inpainting in a defined direction and the **Detail** controls allow for greater control and cloning of high frequency textures from another part of the source image, or even from a different image using the **Detail** input. Inpaint also benefits from GPU acceleration to provide fast results.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                             |
|-----------------|-----------------|--------------------------------------------------------------------------------------|
| Input           | Detail          | The image sequence from which detail is applied to the inpainted area.               |
|                 | Matte           | Controls which areas of the image are affected using the alpha channel or luminance. |
|                 | Source          | The image sequence to which the effect is applied.                                   |

| Control (UI) | Knob (Scripting)  | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Local GPU    | gpuName           | N/A           | <p>Displays the GPU used for rendering when <b>Use GPU if available</b> is enabled. Local GPU displays <b>Not available</b> when:</p> <ul style="list-style-type: none"> <li>• <b>Use CPU</b> is selected as the <b>default blink device</b> in the <b>Preferences</b>.</li> <li>• no suitable GPU was found on your system.</li> <li>• it was not possible to create a context for processing on the selected GPU, such as when there is not enough free memory available on the GPU.</li> </ul> <p>You can select a different GPU, if available, by navigating to the <b>Preferences</b> and selecting an alternative from the <b>default blink device</b> dropdown.</p> <div>  <b>Note:</b> Selecting a different GPU requires you to restart Nuke before the change takes effect.         </div> |
| Use GPU if   | useGPUIfAvailable | enabled       | When enabled, rendering occurs on the <b>Local GPU</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| available    |                  |               | <p>specified, if available, rather than the CPU.</p> <div>  <p><b>Note:</b> Enabling this option with no local GPU allows the script to run on the GPU whenever the script is opened on a machine that does have a GPU available. You should also select this if you wish to render from the command line with the <b>--gpu</b> option.</p> </div> <p>See Nuke's <a href="#">Release Notes</a> pages for more information on the GPUs supported by your operating system.</p>                                                                                                                                                                                 |
| Channels     | channels         | rgb           | <p>The effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Fill Region  | fillRegion       | Source Alpha  | <p>Sets the Matte channel used to inpaint the <b>Fill Region</b>. Source pixels are sampled from outside this region and extended into the <b>Fill Region</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b> - do not use a matte.</li> <li>• <b>Source Alpha</b> - use the alpha of the Source input.</li> <li>• <b>Source Inverted Alpha</b> - use the inverted alpha of the Source input.</li> <li>• <b>Matte Luminance</b> - use the luminance of the Matte input.</li> <li>• <b>Matte Inverted Luminance</b> - use the inverted luminance of the Matte input.</li> <li>• <b>Matte Alpha</b> - use the alpha of the Matte input.</li> <li>• <b>Matte Inverted Alpha</b> - use the inverted alpha of the Matte input.</li> </ul> |

| Control (UI)      | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                        |
|-------------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Smoothness        | smoothness       | 1             | Controls the smoothness of the inpainted area. Higher values can help to reduce flickering between frames, but at the expense of local detail.                                                                                                                                                  |
| L*a*b* Colorspace | LABColourSpace   | disabled      | When enabled, converts the inpainting to the LAB colorspace, which can improve the result.                                                                                                                                                                                                      |
| Stretch           |                  |               |                                                                                                                                                                                                                                                                                                 |
| Amount            | stretchAmount    | 0             | Sets the amount of stretch applied to the edge pixels in the direction indicated by the <b>Direction</b> control.                                                                                                                                                                               |
| Direction         | stretchDirection | 0             | Sets the direction of stretch in degrees when <b>Amount</b> is set to any value greater than 0. You can use the direction to align linear features in the inpainted area, such as road markings or brick work.                                                                                  |
| Detail            |                  |               |                                                                                                                                                                                                                                                                                                 |
| Source            | detailSource     | Source        | Sets where detail is recovered from, the <b>Source</b> input or the <b>Detail</b> input. This allows you to recover detail from another image entirely, such as a grain sample.                                                                                                                 |
| Amount            | detailAmount     | 0             | Controls the amount of high-frequency detail to add back into the inpainted area, where 0 is none and 1 is all the detail from the detail source. Values greater than 1 multiply the detail.<br><br>An example of detail you might want to recover is grain, which can be erased by inpainting. |
| Translate         | translate        | 0,0           | Controls the xy coordinates from which detail is recovered. If the <b>Detail</b> input is a different format to the <b>Source</b> input, you might not get the results you expect, but you can use the <b>Detail Center</b> to correct the offset of the Viewer widget.                         |
| Rotate            | rotate           | 0             | Sets the rotation of the detail recovered, in degrees, relative to the <b>Detail Center</b> controls. Adjusting the <b>Detail Center</b> changes the relative rotation.                                                                                                                         |

| Control (UI) | Knob (Scripting) | Default Value                                                                   | Function                                                                                                                                                                                                                                                                                                     |
|--------------|------------------|---------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Scale        | scale            | 1                                                                               | Sets the scale of the detail recovered relative to the <b>Detail Center</b> controls. Adjusting the <b>Detail Center</b> changes the relative scale.                                                                                                                                                         |

# Laplacian

The Laplacian node takes the input image, applies a blur, and then subtracts the original from the blurred input to produce an image useful for edge detection or motion estimation. Apply different smoothing filters to the output to trade off between speed (box) and quality (gaussian).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                  |
|-----------------|-----------------|-----------------------------------------------------------|
| Input           | unnamed         | The image sequence to which you want to apply the filter. |

| Control (UI)  | Knob (Scripting) | Default Value | Function                                                                                                                                                                         |
|---------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Laplacian Tab |                  |               |                                                                                                                                                                                  |
| channels      | channels         | all           | <p>The effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select</p> |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                        |
|----------------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                  |               | individual channels.                                                                                                                                                                                                                                                                                                                            |
| size           | size             | 3             | Adjusts the size of pixels within the channel defined by the <b>channels</b> control. Values less than 3 increase the light pixels and vice versa.                                                                                                                                                                                              |
| filter         | filter           | gaussian      | <p>Sets the filter algorithm to use:</p> <ul style="list-style-type: none"> <li>• box</li> <li>• triangle</li> <li>• quadratic</li> <li>• gaussian</li> </ul> <div>  <b>Note:</b> Box is the fastest to render, whereas Gaussian blur is the smoothest. </div> |
| n/a            | quality          | 15            | <p>Controls the level of filtering quality. Entering a low number runs the calculation more quickly, but the end result isn't quite as smooth.</p> <p>The image is scaled down during the calculation, so that the blur filter is no larger than this number, and then scaled up with linear interpolation after filtering.</p>                 |
| crop to format | crop             | enabled       | When enabled, crop the resulting image to the format. If the bounding box is at or inside the format, don't enlarge it past the format. This avoids creating oversized images that you don't need.                                                                                                                                              |
| mask           | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                   |
|                | maskChannelInput | none          | The channel to use as a mask. By default, the effect is limited to the non-black areas of this channel.                                                                                                                                                                                                                                         |
| inject         | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the                                                                                                                                                                                                                                  |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                     |
|--------------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------|
|              |                  |               | same mask further downstream.                                                                                                |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel, so that the effect is limited to the non-white areas of the mask.                       |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask. |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                          |

# LevelSet

Within a single channel determined by the **channel** control, LevelSet outputs the distance from a pixel in the Viewer to the nearest pixel in the input channel with the value set in the **threshold** control.

LevelSet can be used to make high-quality dilate or unpremultiply operations. When **gradient out** is set to **rgba**, LevelSet outputs the motion vectors of pixels in the Viewer using the **red** (x axis) and **green** (y axis) values.

## Inputs and Controls

| Connection Type | Connection Name | Function                                       |
|-----------------|-----------------|------------------------------------------------|
| Input           | unnamed         | The input sequence to dilate or unpremultiply. |

| Control (UI) | Knob (Scripting) | Default Value | Function |
|--------------|------------------|---------------|----------|
| LevelSet Tab |                  |               |          |

| Control (UI)         | Knob (Scripting)     | Default Value | Function                                                                                                                                                                                                                                                                                                                                         |
|----------------------|----------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| channel              | channel              | rgba.alpha    | The levelset is only calculated for this channel.                                                                                                                                                                                                                                                                                                |
| threshold            | threshold            | 0.5           | Sets the pixel value that the Viewer pixel distance is measured from.                                                                                                                                                                                                                                                                            |
| level set out        | N/A                  | enabled       | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                         |
|                      | output               | rgba.alpha    | Write distance from the threshold crossing to this channel.                                                                                                                                                                                                                                                                                      |
| gradient out         | gradient             | motion        | Write gradient vectors to these channels. These vectors point toward the threshold crossing.                                                                                                                                                                                                                                                     |
| create matte         | create_matte         | disabled      | Output a matte channel rather than a level set.                                                                                                                                                                                                                                                                                                  |
| dilate               | matt_limit           | 0             | Output matte is the level set thresholded at this value. This is a good way to grow a matte. Negative values shrink the matte.                                                                                                                                                                                                                   |
| extrapolate channels | extrapolated         | none          | <p>If the <b>creatematte</b> button is turned on and <b>extrapolatechannels</b> is set to something other than <b>none</b>, the colors at the edge of the original matte are extrapolated as the matte is expanded.</p> <p>Unless <b>gradientextrapolate</b> is enabled, this function simply copy uses the color of the closest edge pixel.</p> |
| gradient extrapolate | gradient_extrapolate | disabled      | Instead of copying the nearest pixel, colors are extrapolated as a gradient to produce a ramp.                                                                                                                                                                                                                                                   |

# Matrix

Adds a user defined matrix to the input allowing you to multiply all or specific channels by the matrix values. You can copy and paste an existing matrix, using the Animation menu, or adjust individual fields manually.

The matrix controls how each pixel in the source image is affected by those around it, for example,

```
-1  -1  -1
-1   8  -1
```

$$\begin{matrix} & -1 & -1 & -1 \\ -1 & 8 & -1 & -1 \\ -1 & -1 & -1 & -1 \end{matrix}$$

produces an edge detection filter (see [EdgeDetect](#)) by multiplying the center pixel by 8 and the surrounding pixels by -1, and then adding the nine values together to calculate the new value of the center pixel. This process is repeated for every pixel in the source image to create the output image.

**Note:** Matrix results that fall outside the 0-1 range are clipped.

## Inputs and Controls

| Connection Type | Connection Name | Function                              |
|-----------------|-----------------|---------------------------------------|
| Input           | unnamed         | The image to pass through the matrix. |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                                                                              |

| Matrix Tab   |                  |               |                                                                                                                                                                                                       |
| channels     | channels         | all           | <p>The effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p> |
| matrix       | matrix           | N/A           | Defines the matrix used to multiply all or specific channels. You can copy and paste an existing matrix, using the Animation menu, or adjust individual fields manually.                              |
| normalize    | normalize        | disabled      | When enabled, the matrix is divided by a constant so that it's sum is 1 (where possible). This causes the output image to have the same brightness as the source image.                               |
| mask         | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                         |

| Control (UI) | Knob (Scripting) | Default Value | Function                                                                                                                                     |
|--------------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
|              | maskChannelInput | none          | The channel to use as a mask. By default, the effect is limited to the non-black areas of this channel.                                      |
| inject       | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream. |
| invert       | invert_mask      | disabled      | Inverts the use of the mask channel, so that the effect is limited to the non-white areas of the mask.                                       |
| fringe       | fringe           | disabled      | When enabled, only apply the effect to the edge of the mask.<br><br>When disabled, the effect is applied to the entire mask.                 |
| mix          | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                                          |

# Median

Input image pixels within the filter area, defined by the **size** control, are sorted into order and the median pixel is output to the Viewer. Median filter are very good at removing single pixel noise, with only a slight loss of sharpness as a side effect.

## Inputs and Controls

| Connection Type | Connection Name | Function                                 |
|-----------------|-----------------|------------------------------------------|
| Input           | unnamed         | The image to apply the median filter to. |

| Control (UI)    | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                  |
|-----------------|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Median Tab      |                  |               |                                                                                                                                                                                                                                                                                                                           |
| channels        | channels         | all           | <p>The effect is only applied to these channels.</p> <p>If you set this to something other than <b>all</b> or <b>none</b>, you can use the checkboxes on the right to select individual channels.</p>                                                                                                                     |
| size            | size             | 3             | Defines the filter area, in pixels, to apply the median across.                                                                                                                                                                                                                                                           |
| ignore top line | ignore_top_line  | disabled      | <p>When enabled, the top line of pixels is ignored within the filter box to account for different area calculation methods.</p> <div>  <b>Note:</b> Enable this control for backward compatibility to pre 6.2v1 versions of Nuke. </div> |
| mask            | N/A              | disabled      | Enables the associated mask channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                             |
|                 | maskChannelInput | none          | The channel to use as a mask. By default, the effect is limited to the non-black areas of this channel.                                                                                                                                                                                                                   |
| inject          | inject           | disabled      | Copies the <b>mask</b> input to the predefined <b>mask.a</b> channel. Injecting the mask allows you to use the same mask further downstream.                                                                                                                                                                              |
| invert          | invert_mask      | disabled      | Inverts the use of the mask channel, so that the effect is limited to the non-white areas of the mask.                                                                                                                                                                                                                    |
| fringe          | fringe           | disabled      | <p>When enabled, only apply the effect to the edge of the mask.</p> <p>When disabled, the effect is applied to the entire mask.</p>                                                                                                                                                                                       |
| mix             | mix              | 1             | Dissolves between the original image at 0 and the full effect at 1.                                                                                                                                                                                                                                                       |

# MotionBlur

MotionBlur (NukeX and Nuke Studio only) uses the same techniques and technology as the motion blur found in [Kronos](#) to add realistic motion blur to a sequence, but presents the controls in a less complex, more user friendly way.

## Inputs and Controls

| Connection Type | Connection Name | Function                                                                                                                                                                                                                                                                                |
|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inputs          | FgVecs          | If the motion in your input sequence has been estimated before (for example, using FurnaceCore's F_VectorGenerator or third-party software), you can supply one or more vector sequences to MotionBlur to save processing time.                                                         |
|                 | BgVecs          |                                                                                                                                                                                                                                                                                         |
|                 | Matte           | If you have separate vectors for the background and foreground, you should connect them to the appropriate inputs and supply the matte that was used to generate them to the <b>Matte</b> input. If you have a single set of vectors, you should connect it to the <b>FgVecs</b> input. |
|                 | Source          | An optional matte of the foreground, which may improve the motion estimation by reducing the dragging of pixels that can occur between foreground and background objects.                                                                                                               |
|                 |                 | The sequence to receive the motion blur effect.                                                                                                                                                                                                                                         |

| Control (UI)   | Knob (Scripting) | Default Value | Function                                                                                                                       |

# MotionBlur2D

MotionBlur2D does not produce motion blur independently. It actually collates UV motion information from the **2D transf** input (for example, a Transform node) to output UV vectors down the node tree to a VectorBlur node, producing motion blur based on these vectors.

[MotionBlur3D](#) does a similar job, but for camera moves instead of 2D transforms.

See also [MotionBlur](#), [Transform](#), [Tracker](#), and [VectorBlur](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                                           |
|-----------------|-----------------|--------------------------------------------------------------------|
| Input           | 2D transf       | UV transform information, for example a Transform or Tracker node. |
|                 | unnamed         | The image sequence to receive the motion blur.                     |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                 |
|------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MotionBlur2D Tab |                  |               |                                                                                                                                                                                                                                                                                                                          |
| Output UV        | uv               | motion        | Sets the <b>2D transf</b> input channel(s) from which the motion vector information is derived.                                                                                                                                                                                                                          |
| shutter          | shutter          | 0.5           | Enter the number of frames the shutter stays open when motion blurring. For example, a value of 0.5 corresponds to half a frame. Increasing the value produces more blur, and decreasing the value less.                                                                                                                 |
| shutter offset   | shutteroffset    | start         | Controls how the shutter behaves with respect to the current frame value: <ul style="list-style-type: none"> <li>• <b>centred</b> - center the shutter around the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29,5 to 30,5.</li> </ul> |

| Control (UI) | Knob (Scripting)    | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|---------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                     |               | <ul style="list-style-type: none"> <li>• <b>start</b> - open the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 30 to 31.</li> <li>• <b>end</b> - close the shutter at the current frame. For example, if you set the shutter value to 1 and your current frame is 30, the shutter stays open from frame 29 to 30.</li> <li>• <b>custom</b> - open the shutter at the time you specify. In the field next to the dropdown menu, enter a value (in frames) you want to add to the current frame. To open the shutter before the current frame, enter a negative value. For example, a value of - 0.5 would open the shutter half a frame before the current frame.</li> </ul> |
|              | shuttercustomoffset | 0             | If the <b>shutter offset</b> control is set to <b>custom</b> , this field is used to set the time that the shutter opens by adding it to the current frame. Values are in frames, so -0.5 would open the shutter half a frame before the current frame.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

# MotionBlur3D

While similar to the MotionBlur2D node in that it does not produce motion blur independently, MotionBlur3D is designed specifically for camera moves rather than 2D transforms. MotionBlur3D collates UV motion information from the **cam** input to output UV vectors down the node tree to a VectorBlur node, producing motion blur based on these vectors.

See also [Camera](#) and [VectorBlur](#).

## Inputs and Controls

| Connection Type | Connection Name | Function                                              |
|-----------------|-----------------|-------------------------------------------------------|
| Input           | cam             | Connect a camera to provide UV transform information. |
|                 | unnamed         | The image sequence to receive the motion blur.        |

| Control (UI)     | Knob (Scripting) | Default Value | Function                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MotionBlur3D Tab |                  |               |                                                                                                                                                                                                                                                                                                                                                                                                              |
| Output UV        | uv               | motion        | Sets the <b>cam</b> input channel(s) from which the motion vector information is derived.                                                                                                                                                                                                                                                                                                                    |
| Z input          | N/A              | disabled      | Enables the associated channel to the right. Disabling this checkbox is the same as setting the channel to <b>none</b> .                                                                                                                                                                                                                                                                                     |
|                  | Z                | none          | The channel to use for Z depth information.                                                                                                                                                                                                                                                                                                                                                                  |
| distance         | distance         | 1             | <p>Sets the distance to the object to blur. Higher values cause camera translations to contribute less to motion blur and vice versa. You can set <b>distance</b> to <b>inf</b> to use rotations only.</p> <div>  <b>Note:</b> If a Z input channel is provided, <b>distance</b> is a multiplier for the distance. </div> |
